From what I have gathered, the fonts do not work.
You are supposed to use macro-command load_font
but it doesn't work. If you would like more info,
write back. If someone fixed this, please tell me.

3. Wanted: Word Perfect for the ST

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 02:42:50 UTC
From: cs902117@ariel.yorku.ca
Message-ID: <1992Jul1.024250.9137@newshub.ariel.yorku.ca>
Source record: 220322

I would like to get a copy of WP (4.1 preferred, but would go for earlier versions if cheaper) but I am on a tight budget. I do recall that someone was selling a copy for $35-45 which is the range I am looking at. It would be best if I got it from a fellow Canadian (shipping charges are definately cheaper, and no need to worry about exchanges and charges for exchanging currency, which I have been fed up with lately), but I will always buy a copy from the US if need be. If you have a copy for sale, leave me mail!

>reason for the binaries group anymore either. It's a tremendous waste
>of resources to send bits all around the planet when you can send them
>to an archive once and retrieve them on-demand.

I have to disagree at this point. If 6-10 users from your site
all request the mail version, you've just upped bandwidth. Plus
the mail transport system is less geared to moving masses of binaries
around, and sites with small spools are going to be a bit upset.
The whole purpose of binary groups is that site who cannot handle
the traffic do not subscribe. With mail, you don't know how it would
be routed.

8. nroff, manpages, ...

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 06:53:04 UTC
From: monnier@disuns2.epfl.ch
Message-ID: <1992Jul1.085304@disuns2.epfl.ch>
Source record: 220327

Why are all these mint utils manpages nroffed ?

How could I translate them into readable form ?
I found an nroff package for ST but it didn't work the way I wanted
(no matter which manpage I wanted to translate it always told me there
were unknown commands (even for the .SH command)) and, even better,
it always crashed at the end of a file !

Where could I find an util to translate into nice ASCII form ?

|> the next day.
|>
|> Dave Baggett
|> dmb@wam.umd.edu

What? I hadn't realised you had a monopoly on these kinds of programs. I've obviously committed a bigger crime than I realised. BTW there was a smiley on my comment.

All that happened is that I got, what is probably a very early version of your program, decided it didn't do what I wanted and wrote my own. Now that I have I'm willing to share it with the net. What's the problem?

If I'd asked you to change QD Play I'd have missed out on all the fun of fiddling with samples. Like last night's session adding .AU file support and auto gain control. OK, maybe its a weird way of having fun but I'm a weird kind of guy.

|>Jeez; I never thought I'd see the day when we'd have a contest over
|> whose cheesy AUTO folder/command line sample playing program was best.

Who's having a contest? I'm sorry if you regard ST samples as your private patch as I do get that impression. Surely this town's big enough for the both of us?

10. Re: AN COOL

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 08:01:24 UTC
From: tim@spc.nl
Message-ID: <1992Jul01.080124.12646@spc.nl>
Source record: 220328

I recently saw the An Cool demo as well. To begin with I thought it was some sort of joke, but after talking to Tanis of TCB we found out that An Cool was really serious about this demo. IT IS THE LAMEST PIECE OF SHIT I HAVE SEEN IN TWO YEARS. Don't bother getting a copy of it unless you want all of your opinions of TCB to dissapear in an instant.

There are two other acid type demos that I know of on the ST. One is on a demo by a group called Chaos from Manchester in England, the other is by a group called The Lost Boys from England. It contains a screen called Komische Sackratten von der Hohle (Strange Pubic lice from the crevice!) which will probably be what you are looking for.

I don't really mean to be to offensive about this demo but I really must tell you that there are literally hundreds of demos on the ST that are many times better than 'An Cool demo 3'. It is almost embarrassing.

Manikin & Digital Insanity
of The Lost Boys.

I had exactly the same problem recently and seem to have tracked it
down to the lack of memory. When I increased that all was OKm except
that emacs.ttp refused to run becuase it said my terminal wasn't good enough,
I tried every combination in TERMCAP but no luck.

13. CHinDEX: English version now available!

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 10:37:05 UTC
From: bohn@utrurt.uucp
Message-ID: <1992Jul1.103705.24042@utrurt.uucp>
Source record: 220331
Cross-posted to: sci.lang,comp.sys.atari.st

```
The English version of CHinDEX is now available! It gives the
exact page number(s) of any looked-up characters in "A Chinese-
English Dictionary", Beijing: Shangwu yinshuguan, 1985.

For further information contact the author at:
"bohn@utrurt.uucp"
or "...!unido!utrurt!bohn"
or "bohn%utrurt@unido.informatik.uni-dortmund.de"

------------------------------------------------------------
C H i n D E X

the Electronic Index to
"A Chinese-English Dictionary"
and
"Das Neue Chinesisch-Deutsche Woerterbuch"
by Hartmut Bohn

(Demo version available on ftp!)
------------------------------------------------------------

CHinDEX - and looking up Chinese characters becomes a pleasure!

* The ideal tool for people who have to do a large quantity of
translation from Chinese to English or German!

* Highly optimized radical index with graphical user interface,
ordering of radicals according to radical productivity,
multiple indexing of characters and consideration of character
lookup frequencies!

* Optimized Pinyin index. You forgot the correct tone? No problem!

* Simplified four corner index - nothing is faster!

* Stroke index of characters hard to identify.

* In the full version, as the result of the lookup all pronun-
ciations and corresponding page number(s) of the selected
character in the dictionary are given!

* Change lookup method with a single mouse click!

* Favourite lookup method can be preset!

* All character lists are ordering dynamically according to
individual lookup frequency!
```

* Can be used both as program and desk accessory! Dictionary lookup from within your word processor!

* Indexes to other special dictionaries planned!

Hardware requirements:

ATARI ST/STE with monochrome monitor (SM 124)
and at least 1 MB of RAM. Hard disc recommended.

A demo version is available via ftp at:

kth.se (130.237.72.201) in the directory "CJK/atari/CHINDEX"

read the readme in nroff. it mentions that u have to have the macro packages in order to deal with manpages. i assume u are using a shell like gulam, bash, ksh, tcsh, etc. in this case copy the tmac.an file to a convenient place (say c:\lib) and setenv TMACDIR c:\lib. then doing:

nroff -man nroff_man_file >ascii_man_file

should do the job.

the other alternative is to do this on a unix system. for pure ascii output, try:

nroff -man nroff_man_file | ul -t dumb >ascci_man_file

ul will strip out the stuff to make bold, underline, etc.

i have finally decided to work on nroff (again) after i finish a port of paul vixie's cron/crontab to MiNT. expect a new nroff this summer.

16. lh5 for UNIX, now stop whining

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 12:39:39 UTC
From: winfrvk@dutiws.tudelft.nl
Message-ID: <1847@dutiws.tudelft.nl>
Source record: 220336

Hello all,

I have been using a UNIX lha which understands lh5 archives for a couple of months now. Unfortunately, I forgot where I got it from, so I did 'archie lha'

And guess what: the very first site it comes up with contains the version which I know works with Quester-generated lh5 archives.

Host akiu.gw.tohoku.ac.jp

Location: /pub/unix
DIRECTORY drwxr-xr-x 512 Apr 1 17:44 lha

I would be happy to put it on atari.archive if someone mails me the proper procedure (like where to put it and who to inform).

Let's hope this settles the (incorrectly named) lz5 war.

Bart.
schuller@dutikos.tudelft.nl
winfrvk@dutiws.tudelft.nl

17. ACMGDOS & EASYTEXT don't work

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 13:38:40 UTC
From: pate@ra.cs.man.ac.uk
Message-ID: <5199@m1.cs.man.ac.uk>
Source record: 220347

Has anybody got 'acmgdos' to work with the DTP program 'EasyText' ??

Am I missing something glaringly obvious? I use the 'assign.sys' file
that comes with 'EasyText', put the fonts in the correct directory, and
stick 'acmgdos' in the Auto directory. Acmgdos does not complain or
anything and seems to work fine, but when I run EasyText it says that
no fonts are loaded because GDOS hasn't run.

If anyone knows how to fix this, do you also know how to get it to print
to an Oki Microline 182, 9 dot matrix printer (IBM Proprinter compatable
I think).

The setup is a 520STFM (soon to be upgraded to 2.5 Meg, yipeee!) with
two double sided drives.

(Is it acmgdos or amcgdos? Cant remember, dont care)

18. unix lha-1.00 uploaded to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 14:34:30 UTC
From: rosenkra@convex.com
Message-ID: <1992Jul01.143430.26375@convex.com>
Source record: 220337

i was informed of an lharc (100% C) that runs on unix (presumably can
be ported to VMS). i grabbed lha-1.00.tar.Z from ftp.uni-muenster.de.
it does seem to work on lh5 archives (i tried 2 that i had laying around).
i only tested the "t", "v", and "x" options and only visually inspected
extracted text files. i don't recall if dates were preserved either.

i uploaded lha-1.00.tar.Z to atari.archive.umich.edu. i did not find it
there before. if this is a duplicate, ignore. otherwise, it should probably
go in the archivers/unix dir eventually.

it is now in atari/new and should find its way to newitems eventually.
in the mean time, you can retrieve it if u know its name from the new dir
(eventho u can't do a dir list there, u can still cd to that dir).

docs are mostly japanese. "lha" with no args prints a synopsis which is
fine for most needs (at least mine). perhaps someone can translate the
manpage or has an english version they can post.

i also suggest this be formally posted to comp.{sources,binaries}.atari.st
for "orthogonality" if it is found to be robust after more testing.

hopefully we can get back to work now, and stop flaming lharc (myself
included), at least until the format changes (again). i also suggest
we standardize on this. i am going to build it with gcc 1.40 tonite with
optimizations (-O, inlining, etc) to see how much faster questor's assembly
coded lharc is (i have 2.01e, i think). if C is within 10% of assembler,
i suggest that we standardize on one (portable) version. as i recall, gcc
compiled zoo is within +/-10% in speed of lharc 2.01e. the i have not
checked the latest and greatest asm lharc, but will endeavor to do so, in
the interest of objectivity. i can't check PC lharc archives, so if someone
has one, perhaps you could make arrangements to either send it to me or
test it yourself and report your findings. i also suggest that someone
with gcc 2.x try the new optimization options (-O2) and report their
performance findings relative to the assembler version. my past experience
is that gcc produces tight optimized code. it might not be a bad idea to
test laser C, sozobon, and other popular compilers, too.

the GEM-only crowd may be able to convince the archiver shell developers
to incorporate lha as well.

if this lha works, mention of it should be made in this group's FAQ as well.
this should reduce net traffic and lharc flame wars :-).

i also tend to agree with the poster (who mentioned that there are shareware
versions of lharc) that requiring $$$ for "guilt-free" use of such a code
is unacceptable. i believe in shareware, but not for things like archivers.
note that i have not personally seen a shareware version of lharc so this

may or may not be accurate information.

note: this does NOT imply that i am willing to become the focal point for lharc, in any way. i just want to resolve this issue. it also does not imply that i endorse lharc in any way. personally i don't care what is used so long as it is consistent and universal (as much as possible). if anything, i prefer tar/compress myself, tho zoo has been acceptable, too. all of these have their warts (TOS can't handle file.tar.Z, zoo 2.1 needs TZ set correctly, etc).

enjoy...

>all request the mail version, you've just upped bandwidth. Plus
>the mail transport system is less geared to moving masses of binaries
>around, and sites with small spools are going to be a bit upset.

But that's simply not true. This mail message will be mailed around
the world to thousands of sites at a nontrivial cost. The same goes
(even more) for any binary posts. The point is that news is not an
on-demand transmission, while archive servers are. Your 6-10 argument
only works if you assume that *every* site that gets the newsgroup
makes that many requests. In reality the 6-10 redundant requests at
your site are easily made up for by the 1,000 sites that get this group
at which no one makes a request at all.

This group is read by something like 40,000 people and is automatically
fed to many sites. (Consult the latest arbitron statistics in news.lists
for the exact number.) Not only that, but it's tied to the info-atari
mailing list which has who-knows-how-many subscribers.

Your argument that sites that can't take the bandwidth of a group can
decline it is well taken but made somewhat less convincing by the fact
that if one site doesn't take a group then none of the sites
"downstream" from it can have it either. So their are other
implications of the decision not to carry a group.

While meta-discussion about bandwidth are tiresome, it's clear that an
occassional reminder is necessary. You can't really expect every news
reader to learn how Usenet works overnight. It's easy to read news for
years without ever knowing (or caring) about how the underlying
transport mechanism functions. But rampant ignorance can unfortunately
run up the overall cost of Usenet enormously and threaten its very
existence.

It's time to sell off the ST stuff to make room for new toys...

Atari 520STfm with 1M RAM and 720K internal floppy
Atari Mono Monitor
Excellent condition. All original packaging and manuals
Asking $250 or best offer.

6 month old Connor CP340 (40M SCSI 3 1/2") in full height
"shoebox" enclosure with ICD controller (includes clock).
Asking $250 or best offer.

I'll take care of UPS shipping within the continental US.
Please email replies or call (evening) 219-233-6889.

In article <1992Jul1.083340@lssec.bt.co.uk> msmith@lssec.bt.co.uk (Martin Smith) writes:
>What? I hadn't realised you had a monopoly on these kinds of programs.
>I've obviously committed a bigger crime than I realised. BTW there was
>a smiley on my comment.

I don't have a monopoly on anything; I just said I couldn't *understand*
why anyone would write a subset of someone else's free program and then
denigrate the original in the documentation. Seems like a contest to
me. You're pretending to be a lot more naive than you are, and it's
obvious.

>All that happened is that I got, what is probably a very early version
>of your program, decided it didn't do what I wanted and wrote my own.
>Now that I have I'm willing to share it with the net. What's the
>problem?

Since you asked, the problems include the following:

1. You posted the binary to this group.
2. You (admittedly) rewrote a subset of QD Play without
giving any credit to the original author.
3. You put snide (and incorrect) remarks about QD Play
in your doc file.

All of these are minor; come to think of it, I really don't care enough
about any of them to be responding to this message. Send me email if
you want to continue this utterly pointless discussion.

>If I'd asked you to change QD Play I'd have missed out on all the fun
>of fiddling with samples. Like last night's session adding .AU file
>support and auto gain control. OK, maybe its a weird way of having fun
>but I'm a weird kind of guy.

Fine. It's not like I don't understand the concept of hacking for the
sake of hacking. But why not at least say, "Randplay, inspired by
Dave's QD Play?" That's what I did when I wrote Beep; I at least
mentioned that I'd based it on Dan Wilga's newbell. It costs nothing.
And why the urge to slam QD Play in your docs? Did you think I'd never
read them?

>Who's having a contest? I'm sorry if you regard ST samples as your
>private patch as I do get that impression. Surely this town's big
>enough for the both of us?

Well you've got the wrong impression. I regard net etiquette,
politeness, and giving credit where credit is due as important. If you
don't, that's fine with me, but don't expect me to sit silenty by while

you rewrite one of my programs without giving me any credit and then insult the original.

> (no matter which manpage I wanted to translate it always told me there
> were unknown commands (even for the .SH command)) and, even better,
> it always crashed at the end of a file !

nroff uses 'macro' packages to define what all those commands mean.
To preview man pages on my system, I use (the macro package is called
'an'):

```
nroff -man butt.man | more
```

(See why the macro package is called 'an' ? *:^))

24. termcap/curses problem

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 18:12:06 UTC
From: sjaak@research.ptt.nl
Message-ID: <sjaak.710014326@athena.research.ptt.nl>
Source record: 220343

The following short program does not behave correctly, when compiled
using gcc-1.40 and the termcap/cursus-libraries from crsolb12.zoo.

```
#include <curses.h>

main() {
initscr();
mvaddstr(0,0,"this is text");
refresh();
mvaddstr(0,0,"this is junk");
refresh();
getch();
endwin();
}
```

In the output the string "this is " gets erased by the second refresh.
The cursor is positioned on the 8th column using a tab, and a tab seems
to be erasive. I used several termcaps, including the one that comes
with crssrc12.zoo, and tried both tos and mint but to no avail. Ideas?

26. mint util manpages uploaded...

Newsgroup: comp.sys.atari.st
Date: 1992-07-01 18:35:23 UTC
From: rosenkra@convex.com
Message-ID: <1992Jul01.183523.2480@convex.com>
Source record: 220341

i posted a set of manpages for the MiNT utilities that came with 0.94.
all i did was take the readme.utl file and split it up, creating a
small manpage for each program. since many of these utilities are
designed for shells with missing features (eg bg, pipe), these manpages
may be of little use. however, i saved you the time. manpages for
some (including ps, mintvers, top, limit) would probably be handy.

look for mutl94m.zoo at atari.archive.umich.edu. included are both
nroff source and nroffed manpages (for manpager).

Hi!
I would suggest a Mega STE/4, a 80 Meg HDD and a SM146.
I think you will get this for the same prize (without software, naturally),
if you look for a cheap dealer.

bgilbert@cs.washington.edu (Benjamin Gilbert) writes:

> Well I don't know Notator but you probably can run it from floppy.

You can. It will take a while to load off the floppy, but once it's in memory, it never uses the disk except to store and retrieve user files. So if you use your machine on Notator all day (like I do), you won't notice crippling problems (naturally, disk functions will be reeeeal slow; it's not hard to make a pretty big Notator file).

> Nope, you can't use an EGA monitor. You can choose either Atari

The C-Lab people say that Notator won't run on a colour monitor. I tried it anyway, since I have one sitting around. It works, but it looks like shit; truly unusable for score editing. It's kind of nice to know that I can use it as an emergency backup monitor if my monochrome monitor dies, tho.

Notator looks great on the SM124 and 147. I have a 147 now and it's superb; very crisp and easy on the eyes. The SM124 has a smaller display area, so can cause a little eye fatigue on late-night sessions, but it's also a good monitor.

You are a serious lamer, dude... Although I agree that that isn't one of TCB's greatest demos (Crikey is really cool, it includes the demo you mentioned) but M Demo 3 had some of the best soundtracker music I have ever heard. It is better than the crappy chip music copied from Mad Max, if thats what you enjoy.

I have about 40 to 50 demos by over 20 coding groups. Although I wouldn't claim to have a very large demo collection (let me tell ya right now, I don't...) compared to others, I have seen a lot of demos on the ST (and the Amiga, for that matter) I believe AN Cool did a GREAT job on this demo (as well as his Acid Burn demos) and his demos are some of the most enjoyable demos to have. (Who needs a lame disting sprite and a lamer scrolline that does tricks?)

Obiwan Kenobi

Source record: 220154
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers,wi.forsale,uwisc.forsale

I have a 49 Megabyte Atari ST hard disk for sale:

-shoebox case, power supply, fan
-host adaptor card (I think it is an older Adaptec
drive controller and an older IDE host adaptor)
-DMA through for connecting multi hd's or laser printers
-all necessary cables
-room for another 1/2 ht hard drive (includes cables for this)
-3 1/2 " hard disk unit
-40ms access time
-reliable
-includes some hd software such as:
format, compression, caching, etc.
-The unit is 4-5 years old, but used only about 2 hrs/week
at the most.

PRICE: $250 you pay UPS COD shipping.
(or BEST OFFER)

Reason for selling: It isn't used much, because I haven't
made time for my Atari.

Please send E-Mail if interested.
Make me an offer!!!

Hi!

I'm searching for Mr. 'shenson', he wrote the minix filesystem for MiNT.
The email address, I found in the docs (shenson@nyx.cs.du.edu), seems to
be invalid.

Source record: 220155

Well after seeing all the messages about shareware, etc, and the option
came for me to lay a trap..

I mentioned in a light harted way that to get the source caode for LZH201
you should pay Thomas Quester his shareware fee, a few of you fell for this..

I was aghast at the replies that were posted here..

How come you developers are so two faced, you wan't some one to pay for your
shareware software but you won't pay for anothers developers shareware
software fee..

No excuses can be made that its a archiving utitlity, if a developer
spends time and money developing a piece of software and askes for a small fee,
I thing that there is nothing wrong with this, mind you its up to your
conscious to pay..

You can't just make your own laws on this..

Note: 1. Is this why Atari is in such a disarray, that we have 2 faced
developers, and that they have to much pride to help each other.??

Note: 2. ZIP/AJR and Zmodem are not PD, you have to pay to get the source
code for it....!!!

By the way, from memory Thomas Questers fee is not Money, did any of you E-Mail
Thomas to find out..??, I don't think so, but I do hope you find out, and do
enclose a Reply Coupon and a disk...

So I do hope that these 2 faced developers will E-Mail me and tell me what
Thomas Questers Fee is, I do know, it has been posted here before.

Note: 3. Thomas Quester has no access to FTP...

Get with it you guyes....

Roger.....

Message-ID: <1992Jul02.090735.110630@rrz.uni-koeln.de>
Source record: 220158

Hello MiNTers!

Can anybody tell me if there is a Ramdisk that works ok when started from MINT.CNF? I have tried the LUFTSCHLOSS from CLaus Brod's german book 'Schebenkleister', but it didn't work (I got a message about a memory allocation error/conflict/problem or something like that, a rather unfriendly 'bye-bye' from MiNT --- and bombs). As I know now, LUFTSCHLOSS hacks around with the MPB and such dirty things, which work ok as long as you use a single-user-TOS.

Does anybody know a MiNT-clean Ramdisk, and where it can be found?
Thanks for your help!

cu, Andreas

In my mint 0.94 docs it says you need to do an 'stty vt52' to get this to happen. Unfortunately I've yet to find a version of stty that will do this.

Hy,

> I mentioned in a light harted way that to get the source caode for LZH201
> you should pay Thomas Quester his shareware fee, a few of you fell for this.

There is no Shareware fee to pay for Questers LHarc! Only when you use
the other Programs PFX (Program File Packer, onlinepacking for
Programs) or AFX (onlinepacking for other stuff (RSC's, texts,
fonts, ...)) containing in LHarc, you have to pay (you can get them and
the other stuff including in the Archive on dubble-clicking
LZH201L.TTP and tipe in >>x -rmh LZH201L .TTP<<).

As a service for the peoples which pay the shareware fee, Thomas
Quester gives out the Source of LHarc when you send him a disk for
updating and a second for the Source.

I don't know the rules for getting the LHarc-Source for someone, who
is not registered by him, but I can ask Thomas.

Ciao
Herwig

In <1992Jul1.160217.2251@wam.umd.edu>, David M. Baggett writes:
>
>But that's simply not true. This mail message will be mailed around
>the world to thousands of sites at a nontrivial cost. The same goes
>(even more) for any binary posts. The point is that news is not an
>on-demand transmission, while archive servers are.

This is getting waty off the original topic, and we should go to
news.admin to continue, but your above statement is completely wrong.
When you set up your sys file for your site, and get your sender's site
to build a sys file, you specifically ask for groups, unless you just
ask for all. Newgroups can be done automatically, or news can be
configured to mail notice to admins, who then decide whether to
add the new group or not.
If your agrument was true, it would directly contradict the
recent shutting down of several mail servers due to complaints from
admins who's siotes were paying to deliver megabytes of mail they
didn't want, didn't ask for, and sdindn't want to pay for shipping.
When you request files by mail, you have nop idea how it will
be routed to you, and who's site it will pass through.
Currently, many sites in Ontario Canada are changing their map
entries to "terminal" because up here, we pay a lot to ship stuff around,
and doubling of your monthly bill can make you rather anoyed. This of
course is screwwing up and slowing down regular mail, as pathalias now
has a bad weighting builtin when it routes mail, what with all the private
sites dropping routing info.
While it may look like a free network to a user at an .edu site(this
is not a flame), there is a large percentage of sites which pay to get
and ship news.
If you have access to an archie server, find a site that archives
news.admin. I beleive the discussion on these issues occured ~3 months
ago.

Your 6-10 argument
>only works if you assume that *every* site that gets the newsgroup
>makes that many requests. In reality the 6-10 redundant requests at
>your site are easily made up for by the 1,000 sites that get this group
>at which no one makes a request at all.
>
As noted above, and to expand, the whole purpose of the .binaries
hierarchy, back in the great renaming, was so sites who wanted binaries
could specifically ask for them, while sites that didn't delete them from
their sys files.

>This group is read by something like 40,000 people and is automatically
>fed to many sites. (Consult the latest arbitron statistics in news.lists
>for the exact number.) Not only that, but it's tied to the info-atari
>mailing list which has who-knows-how-many subscribers.
>
By this group, I assume you mean comp.sys.atari.st, as the last
time I saw the info-atari list, it did not carry binaries.

>Your argument that sites that can't take the bandwidth of a group can
>decline it is well taken but made somewhat less convincing by the fact
>that if one site doesn't take a group then none of the sites
>"downstream" from it can have it either. So their are other
>implications of the decision not to carry a group.

But this is the whole point. If your feed site doesn't supply a group,
you find a seperate feed. If this costs you money, so be it. The net is
not free, and no site is obligated to carry all groups. This argument
comes up a lot in censorship discussions. The general concensus is that
if you really want to read a group, you can always find a feed. No one
is obligatd to supply you a group or feed. If you read Nixpub, you'll
find a listing of suites willing to supply feeds, some for free, some not.
It might cost you long distance charges, but that is your choice.
>
>While meta-discussion about bandwidth are tiresome, it's clear that an
>occassional reminder is necessary. You can't really expect every news
>reader to learn how Usenet works overnight.

Well, if all users would at least read news.announce.newusers,
before posting, there'd be a lot less people making idiots of themselves
in public. (that was not directed at you)
One of the newuser docs recommends reading a group for several months
before posting. I know that that certainly works for me, and the people
who don't follow this guideline stand out like sore thumbs, as I'm sure
you've noticed. As well, there are monthly postings of all newsgroups,
with short descriptions of their charters. (Though you'd never know it
from the number of for sale postings in c.s.atari.tech)

Try reading news.admin and news.groups for a while. All these issus
come up regularly.

>It's easy to read news for
>years without ever knowing (or caring) about how the underlying
>transport mechanism functions. But rampant ignorance can unfortunately

Just a couple of questions,

1) Should program packers, such as ice and the pompey
packer be used with MiNT, i.e. are they legal? If so
which can be used?

2) Before I download MGR, what are the minimum
requirements for running it? What are the 'suggested'
minimum requirements?

Thanks,

C.W.

how helpful.

well there are rz/sz .ttps on atari.archive... but has anyone tried compiling the `normal' un*x zmodem sources with MiNT libraries? could be you don't have to change very much, and the result probably will run faster than any `TOS-only' port. (think of system calls per bytes transferred...)

just a thought :-)

>I thing that there is nothing wrong with this, mind you its up to your
>conscious to pay..

I'm against the use of ANY archiving utility which requires the user to purchase software to de-archive publicly available software.

Why is this?

1. There are plenty of FREE archiving utilities available. ZOO and GNU Tar are examples.

2. IF someone is going to charge money for an archiving utility, then that utility should NOT be used to archive programs available via FTP or via on-line services such as GEnie and CompuServe.

3. I remember the sometimes bitter battles on GEnie with regard to introducing ANYTHING other than .ARC archives. I also remember the brouhaha over other folks demanding 'shareware fees' for their archiving/dearchiving software. It was because of things like this that Xlharc was written -- a publicly available LHarc archiver which didn't cost any money to use.

4. IF LZH201 -requires- a shareware fee in order to be 'legal', then I simply request people use Xlharc or ZOO or GNU Tar to archive the things they place on atari.archive.umich.edu (and other sites). I think it is patently unfair to require payment of a shareware fee to a third party in order to obtain a bit better compression ratio, AND in order to actually unarchive these offerings.

>You can't just make your own laws on this..
>
>Note: 1. Is this why Atari is in such a disarray, that we have 2 faced
>developers, and that they have to much pride to help each other.??

No. We apparently have two-faced ARCHIVE developers, who are out to make a quick buck at the expense of EVERYONE on the network.

>Note: 2. ZIP/AJR and Zmodem are not PD, you have to pay to get the source
>code for it....!!!

Yep. But I don't have to pay to unarchive ZIP files, nor to download files using the Zmodem protocol.

>By the way, from memory Thomas Questers fee is not Money, did any of you E-Mail >Thomas to find out..??, I don't think so, but I do hope you find out, and do >enclose a Reply Coupon and a disk...

If you don't have the faintest idea what the 'shareware' fee is, why are you bringing up charges of '2 faced'?

-- David Paschall-Zimbel

P.S. The latest version of LZH201 (as noted last night) on GEnie specifically states that the archive is SHAREWARE. I again ask all people to STOP USING LZH201 TO ARCHIVE PROGRAMS WHICH YOU WILL PLACE AT AN FTP-ABLE (OR ON-LINE SERVICE) SITE. Use it privately and pay the shareware fee. Don't use it publicly!

Use ZOO instead. It has -lh5- compression AND it doesn't demand a shareware fee in order to be used.

I'm sorry I'm having to continue this discussion here and apologise
to the vast legions of the disinterested. I was going to E-mail but
I can't let Dave's last article pass without comment.

> 1. You posted the binary to this group.

I`ve already explained why and accepted that it was probably a
mistake. I hereby apologise to anyone who feels I wasted their
resources.

> 2. You (admittedly) rewrote a subset of QD Play without
> giving any credit to the original author.

Please do NOT describe my work as a subset of yours. It is NOT a sub
or super set. It is a different set of features that meets my needs.
If it was a subset I wouldn't have needed to write it. It was NOT a
rewrite and I did NOT disassemble your program. As such I believe you
have no basis for the above statement of being the original author. My
program was written after trying out several sample players.

You are now doing to me what you complained I did to you.

> 3. You put snide (and incorrect) remarks about QD Play
> in your doc file.

You have interpreted my remarks in the worst way possible and assumed
they were all directed at you as personal attacks. I stand by what I
said at the time but if it is now incorrect I will be glad to strike
it from the documents. How about a review copy of your latest version
to settle things.

> All of these are minor; come to think of it, I really don't care enough
> about any of them to be responding to this message. Send me email if
> you want to continue this utterly pointless discussion.

Aha, a classic usenet line "I don't care really and it's so trivial
but ...", then a personal attack, then I should send E-mail so you get
to feel good about having put me down in public. You sent the article
anyway didn't you?

>Fine. It's not like I don't understand the concept of hacking for the
>sake of hacking. But why not at least say, "Randplay, inspired by
>Dave's QD Play?" That's what I did when I wrote Beep; I at least
>mentioned that I'd based it on Dan Wilga's newbell. It costs nothing.
>And why the urge to slam QD Play in your docs? Did you think I'd never
>read them?

Inspired? You are trying to extend your monopoly here again. Yours was not the only such program I looked at and none of the others mentioned you as the inventor of sample replay. Oh by the way the SunOS play(6) man page left your name out, perhaps you should give them a ring and have it corrected. As I understand your complaint I should credit every program I've ever looked at that plays sampled sounds in any way. Where do you draw the line? Presumably after I credit you.

I did give credit in the program to 2-Bit from whom I got the sound tables and will credit anyone who provides code, material help, assistance in testing, reports problems or suchlike. I do not knowingly claim credit for the work of other people and believe I did not do so in this case. You are entitled to your opinion on the matter.

Slam? You are very touchy on this subject while also claiming above that it is 'minor'. Did I mention you by name? Did I call you bad things? No I didn't. You are now publicly accusing me of stealing ideas, if not code. It's typical usenet style again. It's a terrible thing for me to criticise you, but you can have a go at me and that's fine.

> Well you've got the wrong impression. I regard net etiquette,
> politeness, and giving credit where credit is due as important. If you
> don't, that's fine with me, but don't expect me to sit silenty by while
> you rewrite one of my programs without giving me any credit and then
> insult the original.

I also believe in politeness, witness the tone I have conducted this thread in. Do you expect me to sit idly by while you accuse me of plagiarism in a public forum?

I think you overreacted and were looking for an argument. I would point out that this 'pointless discussion' was instigated by you, under cover of the old bandwidth chestnut. You could have saved quite a bit of it by E-mailing me with your concerns in the first place.

I would like to see this moved to E-mail too, or dropped. I doubt most people are interested in this predictable squabble.

>
>1. There are plenty of FREE archiving utilities available. ZOO and GNU Tar
> are examples.

I'm still not sure I understand Roger's experiment, but yeah, Zoo is the hands-down favorite now that it has "h" compression and better command line argument parsing (IMHO). Zoo and LHarc have nearly equivalent compression ratios, but Zoo runs on every machine in creation and source is freely available. (Note: before v2.1 of Zoo came out I was an ardent LHarc supporter. But in the absence of enormously better compression factors, I see no reason to use LHarc.)

>2. IF someone is going to charge money for an archiving utility, then that

> on-line services such as GEnie and CompuServe.
>
>[...]
>
>We apparently have two-faced ARCHIVE developers, who are out to make a
>quick buck at the expense of EVERYONE on the network.

I don't really see why an archiver writer shouldn't be allowed to make a "buck" if everyone loves their archiver so, though I do see your point. You could argue the same thing about terminal programs; after all, many users won't be able to get the software if they have to pay a shareware fee to use a program that will let them download it.

An easy solution for the archiver developer is to have TWO programs: un<name> and <name>. The un<name> version would be free, but could only extract files. The <name> version would be shareware but could create the archives (and do all the other neat stuff that archivers do).

It would be important for the author of <name> to keep un<name> up to date with respect to compression algorithms, etc., so that an archive created with *any* version of <name> could be extracted with the latest version of un<name>.

Archivers are difficult to write and are an essential part of computer users' everyday lives. Their authors should be compensated for their work (if they choose to be). In practice, freeware with source (like Zoo) may win out anyway, but that's a free market for you.

This is NOT a good idea. I know for a fact that the Pompey Pirates'
packer crashes every time under MiNT (and so does anything packed
with it) and so decided that trying to use any other packers would
probably not be worth the trouble.

>2) Before I download MGR, what are the minimum
>requirements for running it? What are the 'suggested'
>minimum requirements?

MGR runs fairly happily on my (2.5 Mb) ST, though it tends to
run out of memory a lot when I try to run a couple of shells, Prolog-68,
micro emacs...
Must get some more SIMMs.

It is said that MGR will run on an ST with only 1 megabyte of RAM, but
I didn't try it.

You could write a small program that uses the Dlock() system call to lock
all non-minix partitions. This will prevent all access to those drives.
Run this program before allowing any users to log on.

I really must say that the current version of MiNT is not really set up
for multi-user operation (as you've no doubt noticed!) and so I do urge
caution in allowing remote access to your system.

Also keep in mind that you shouldn't believe everything you read (or hear); *especially* when what is stated is what everyone would like to hear.

I gather that Atari's official announcement of the Falcon is not too far off. Let's not build up false expectations before then.

In article <1992Jul2.151744@lssec.bt.co.uk> msmith@lssec.bt.co.uk (Martin Smith) writes:
>I'm sorry I'm having to continue this discussion here...

No, you're not. You're only interested in convincing people that you
didn't do what it's obvious that you did. If you hadn't come back and
outright lied about this I would have just let this go, as I said, but
I suppose now I'll have to dig into your .zoo and pull out the relevant
details that called you to my attention in the first place (well aside
from the bandwidth thing).

>If it was a subset I wouldn't have needed to write it. It was NOT a
>rewrite and I did NOT disassemble your program. As such I believe you
>have no basis for the above statement of being the original author. My
>program was written after trying out several sample players.

I never claimed you disassembled PLAY.PRG. I just said you used it as
a baseline upon which to add minimal additional functionality. This is
clear from what you have in your doc file:

```
*------------------------------------------------------------------------*
The playback program is more flexible than others of similar function
The basic task of RANDPLAY is to choose a sample from a list and play
it at boot time. There are no silly limits on the number of samples in
the list.

# RANDPLAY.INF file last edited MHS 23/1/92. PLAY.PRG Beater!

f:\replay\mysample\aliens.spl 10000
[...]

[From file RANDPLAY.INF:]

# RANDPLAY.INF file last edited MHS 23/1/92. Beats PLAY.PRG by miles !
*------------------------------------------------------------------------*
```

It's only complete coincidence that you mention PLAY.PRG in your doc
file, right? Mine was just one of many programs called PLAY.PRG, and
with a "silly limit on the number of samples in the list" and an .INF
file of exactly the same format as yours, right?

>You have interpreted my remarks in the worst way possible and assumed
>they were all directed at you as personal attacks.

No, I interpreted them as what they where: simple obnoxious and
baseless put-downs of PLAY.PRG, which I happen to have written. I said
I didn't care that much, but if you're going to publicly lie about the
situation and still refuse to give me credit, I don't see why I
shouldn't be a bit annoyed. What if this were a Ph.D. thesis?

>Aha, a classic usenet line "I don't care really and it's so trivial
>but ...", then a personal attack, then I should send E-mail so you get
>to feel good about having put me down in public. You sent the article
>anyway didn't you?

I wasn't trying to put you down, I was just trying to respond to your not-so-subtle implication that I'm totally out of line here. If I'm more sensitive than some, it's because I've had things plagiarized in the past (the picture formats list, for one). It seems like a trivial matter until it's YOU who's been stolen from.

And, actually, I do think this is a matter of general interest; just as we need to be aware of (and discuss) rules of conduct regarding the net, shareware, etc., so do we need to discuss when it's important to credit sources and when it's not. Especially in our community, which has a lot of good hackers looking for a challenge, you see a lot of this "Joe's program SUCKS; I can do that same thing but ten times better" attitude. Again, I really don't have a problem with that, provided "Joe" is at least given some mention of his pitiful attempt at writing the program in the first place.

In this case perhaps it's a fine line; there may have been programs like QD Play before QD Play was written, and there may have been similar things written independently; when I wrote it I wasn't of aware of any similar programs, otherwise I would have mentioned them. But to use QD Play as a baseline for your own program, mentioning it *by name* in your doc file, and then to criticize it is really unacceptable, IMHO. Like I said, if these were Ph.D. theses and you'd written in the introdcution, "This beats 'Data Abstraction and Lab Rats' by a mile," I bet the author of 'Data Abstraction and Lab Rats' would be pretty annoyed. It's the same concept.

>Inspired? You are trying to extend your monopoly here again. Yours was
>not the only such program I looked at and none of the others mentioned
>you as the inventor of sample replay.

As far as I know I was the first person to write a program like that for the ST. And no, of course I'm not the "inventor of sample replay," but that doesn't mean you can copy my implemenation freely. The Bitmap Brothers didn't invent "video games," but that doesn't mean you can clone Speedball II and not get them pretty upset. Yes, it's a fairly simple program. But it's also simple to credit the author. I mean, jeez, it doesn't cost anything.

>Oh by the way the SunOS play(6) man page left your name out, perhaps
>you should give them a ring and have it corrected.

You're being sarcastic again. SunOS play doesn't run on an ST, doesn't have an .INF file, doesn't run in an AUTO folder, doesn't play samples on a Yamaha sound chip that doesn't even have true D/A capabilities, doesn't support the ST Replay cartridge, etc. It's a completely different program.

>As I understand your complaint I should credit
>every program I've ever looked at that plays sampled sounds in any
>way. Where do you draw the line? Presumably after I credit you.

I draw the line at the point where you decided, "I'm going to write a program that beats PLAY.PRG," as you alluded to in your documentation. You didn't think to yourself, "Gee, I'm going to write a program that plays sounds in the AUTO folder," you thought, "Gee, I have this nifty PLAY.PRG but I'd like to add features to it. I'll make a program that's just like it but better." I don't have a problem with that; I just have a problem with you not giving PLAY.PRG any credit. And for that matter if you hadn't made the obnoxious comments in the doc file I wouldn't have even brought it up. You put the remarks in there to get attention, and you got it.

>I did give credit in the program to 2-Bit from whom I got the sound
>tables and will credit anyone who provides code, material help,
>assistance in testing, reports problems or suchlike.

But you won't credit the person whose program you copied in the first place.

>I do not knowingly claim credit for the work of other people and
>believe I did not do so in this case. You are entitled to your opinion
>on the matter.

Just as you are entitled to lie to save face. Fine. You can post whatever story you want; I'm not posting anything more about this. I've posted my side; I only hope that anyone foolish enough to be reading this thread has been made more aware of the sensitivity surrounding issues of inspired works and outright plagiarism.

>Did I mention you by name?

No, that's the problem!

>I also believe in politeness, witness the tone I have conducted this
>thread in.

Personally, I have witnessed a sarcastic, obnoxious tone. Perhaps I'm the only one who feels that way, though. (Really.)

>I would point out that this 'pointless discussion' was instigated by
>you, under cover of the old bandwidth chestnut. You could have saved
>quite a bit of it by E-mailing me with your concerns in the first
>place.

Ah, and then the world would have never known, right? If you're going to publicly denigrate my program, why should I keep my criticism of yours private?

You could likewise have saved yourself all the trouble by not calling attention to your own transgressions in your doc file.

Source record: 220176

I purchased a complete Lexicor Phase/4 system last year and have used ti
it about 2 hours total. It includes the 3-D animator, the picture
translator, the paint package and the renderer. Of course the package
comes with all manuals and the dongle for using it.

The package retails for
somewhere between $300 and $500 dollars. I will trade this package for
an Atari Lynx game system and a game or two. This is a high end
graphics system, currently being ported to the SGI Indigo line of RISC
workstations. Way more than 1 meg and a hard drive is recommended.
This ain't Degas.

If interested, call 313-368-6915 and ask for Patrick. The project I was
working on which used the Lexicor software has been cancelled, I wanna
console myself with a portable video game system, and I can't spare any
cash 'cause my wife and I are trying to save for a house. Thank you for
your support.

Or, just email me and we'll discuss specifics.

61. TT serial ports

Newsgroup: comp.sys.atari.st
Date: 1992-07-02 21:18:32 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1992Jul2.141833.3428@arizona.edu>
Source record: 220180

Most programs running on a TT which use the serial/modem ports use the particular one selected by the modem CPX.

My question is: Is there some way (I'm sure there is) to change what the selected port is (e.g., with GFA Basic) without calling up the CPX?

Also, I have a serial printer, and with the printer set to the modem port, a screen dump ALWAYS goes to Modem 1, no matter what the CPX is set to (though other outputs go where I want them). Is there some way to change this?

This would all be quite helpful to know, since I have three deviced currently hooked up to serial ports (modem, printer, roommates's computer).

Thanks

I am posting the following for a friend without net access. Please direct responses to:

dasun!nexus!quanh@sunkist.west.sun.com

If this address doesnt work for you, I will be willing to forward messages to him.

**********Atari 520 ST System for Sale**********

I am selling the following:

o Atari 520 ST CPU w/serial, parallel ports, midi port, mouse, pad
o Atari SF354 Single sided floppy drive
o Atari monochrome monitor (needs one capacitor)
o Indus GTS-100 double sided floppy drive
o Epson Spectrum LX-80 dot-matrix printer with tractor feed
o Various software, Atari joystick
o Box of printer paper, other miscellaneous items

This stuff has been sitting in my closet for the last two years. I have no use for it since I have a computer at work. This package is priced to move at $400 (or trade for Nikon Camera lenses?). We can work a deal on the shipping, depending on where you live, etc. No separations, please.

65. Program for STereo Replay owners

Newsgroup: comp.sys.atari.st
Date: 1992-07-02 21:56:00 UTC
From: at731@cleveland.Freenet.Edu
Message-ID: <1992Jul2.215600.10166@usenet.ins.cwru.edu>
Source record: 220183

Just had a file upload to the /new directory at atari.archive.

It takes stereo samples and produces bar graph and oscilliscope displays
on a starfield with a few other options. This is the first version of a
program that's main purpose is to supply a video source when taping
music onto video tape.

The filename is "homebrew.lzh", it's very small, so give it a try and
drop me a line letting me know what you think.

I recently bought a 1040ste, and everything seemed to work for a couple of weeks, then I wanted to debug some machine code and my monitor crashed temporarilly... I'll try and explain what happened:
After starting up monst2.prg, the debugger from hisoft, and quitting with control-c my monitor display shifted to the left (so the black band on the left side gets shorter and the band on the other side longer), and the image is shifted to the right in the new area, the part that would scroll out at the right side wrapped in on the left side... After I got back in the debugger everything returned to normal. I've never had a problem like this with my old 520stm. Anybody know what this is ?

>command line argument parsing (IMHO). Zoo and LHarc have nearly
>equivalent compression ratios, but Zoo runs on every machine in
>creation and source is freely available. (Note: before v2.1 of Zoo
>came out I was an ardent LHarc supporter. But in the absence of
>enormously better compression factors, I see no reason to use LHarc.)

we should learn also that this sort of technology tends to leapfrog. for
a time lharc was faster/more efficient. zoo caught up (and may even overtake
it since with perhaps thousands of potential developers, since everyone
has the source, it may benefit from the next advance, if any).

i hypothesize that this may be the case. in which case we might all just
take a step back and ask more basic questions of "alignment" and what
are the important issues in achivers. in short, how about rational thinking
for a change?

since roger dragged me in, i offer my two cents...

to start things off, here are my own ideas (which i "mentioned" to roger
in private mail). perhaps we could use this to once and for all determine
how atari files are passed on the net. that is the issue. not whether someone
makes money or not. personally, i don't care if thomas questor becomes a
zillionaire from lharc, so long as i can get 100% portable source from him,
even if i have to pay for it. to my knowledge, that is not possible today
for any price. heck, if the issue is he needs a hard disk to support a C
compiler like GNU C, i'd even go so far as to encourage a modest collection
for the guy, so long as he concurrently supports his assembler and a C version.
I think he will soon find, however, that the non-portable asm version would
be a pain to continue, and not worth it with current (and future) C compiler
technology.

and what happens on BBSs or at home is of no concern to us
here. the ONLY issue is the public nature of information exchange here.
perhaps we could use this to either make a final selection (implying a vote)
or (heaven forbid) develop a standard for a new, "universal" archiver. leave
me out of the latter, however (i am neither qualified nor have the stomache
for it :-).

with that said, here are the things i look for in an archiver, with my own
(subjective) weightings:

weight parameter
100 preservation of data (timestamps, dir structures, etc)

99 availability/portability of source code (in case i have
problems with preservation of data, or in other words,
"Use the Source, Luke")
98 fixed file format (published, ideally promulgated as in
tar: IEEE Std 1003.1-1990 and ISO/IEC 9945-1:1990 (E))
50 speed
49 efficiency (packing ratio)
48 features (essentials)
30 features (desirables)
10 features (fluff)

people reversing this list and weightings, IMHO, are either naive or not
serious computer users. this is ok, so long as they don't determine the
fate of the rest of us less naive and more serious users who, in theory
and like any good governing body, know better. "Trust us. You'll thank us
in the long run when 5 years form now you can still get at your data from
your $2000 POSIX/X/RISC workstation since there are STs only in museums and
nobody remembers the 68k instruction set anymore..." :-)

as a minimum, with an eye to the future, i want these features (non-compliant
programs get my ax, with one exception since it is exceptional at the first
3 items above and not bad at the next two):

universal user interface (today that is a command line, tomorrow
it may be X. it will never be GEM, however. here universal
implies TOS, MS-DOS, unix, AMIGADOS, VMS, VM, MVS, etc and
NOT ST/STe/TT/... models. apologies to more esoteric OS's :-)
ability to pack/unpack directory hierarchies
ability to test archive integrity
ability to list contents

lharc, zoo, arc 6.02, zip(?) fill the bill. tar does not offer tests, but
then you can always pack the output of sum(1) as the first file. you could
also zoo (or lharc) the tarfile.

note that lharc is no more than 15% faster than zoo, despite assembler, and
no more than 2% more efficient than zoo in the scores of files i have tested.
the use of assembler has nothing to do with the size of the file, BTW.
its time has passed. and as i recall, there was less than a year between
the emergence of lharc (on the ST, that is) and zoo 2.1 (again on the ST).
feel free to provide more accurate info since this is now just an ultra-vague
memory for me.

i have a question: lharc 2.01e is not able to preserve timestamps on TOS 1.2.
this is a fact that i can demonstrate and have told thomas about it.
has this been fixed in a more recent release? if the answer is "yes", then
lharc is ok (since then things like "make" and "RCS" will work). if the
answer is "no", then it just fell off my list of possible archivers since
it won't allow me to store work in progress (ie source code). note
that lha (the C version) does in fact preserve timestamps, tho it runs much
slower (so far) than either zoo or lharc. to me timestamps are more important
than speed (try fixing the timestamps on a few hundred files and you, too,

will recognize this fact). for this reason, i think if we decide that lharc
is "the way", i think we should adopt unix lha 1.00. at least we have source.
and i'd also recommend letting the japanese developers either coordinate
future development or designate someone (thomas would be a logical choice,
at least in the ST world).

i might also mention that when considering both the time to pack and unpack
an archive, compressed tar files win on the ST. i ran a test that took
268 seconds to tar/compress/uncompress/untar and 306 seconds to lharc/unlharc
and 318 seconds with zoo. very interesting. the .tar.Z was 40% larger than
the .lzh (or .zoo). i imagine that using the "z" option on tar would slow
thing down dramatically, unless compress were loaded from ramdisk.

on the next rung (desirable, tho not essential) are:

add comments (global and on each file)
built-in help or synopsis
intuitive user interface ("x" for extract, "a" for add, etc)

anything else for me is fluff. i only need workmanlike features, not glitz.

i think it fair to assume that:

1) computers will tend to get more powerful, have more memory, etc.
2) more and more users will get hard disks over time.
3) unix is a decent model and may ultimately be atari's direction.
4) GEM is a dead-ended GUI. we should look towards X for now. in
the meantime, tho it might be inconvenient, the LCD is the lowly
CLI (eg gulam). everyone has access to it.
5) C compiler technology is advancing to the point that assembler
is probably only necessary for real-time (games). certainly not
for archivers, as GNU C and zoo have demonstrated.

it is also interesting to note that (not that we need to be "copycats", but
we should understand the reasoning here):

1) comp.binaries.ibm.pc almost exclusively uses zoo (now 2.1).
2) most usenet amiga groups use shar (with uuencoded binaries).
you really wouldn't want to admit an amiga user is smarter
than you, now would you? :-)
3) more "prestigious" groups (eg comp.sources.unix) use shar also
and do not allow binaries (except when essential to the post).
the archive sites preserve the shar files by compressing them
or creating tar files and compressing them. same for GNU.
4) comp.sources.atari.st used to use shar. what happened?

food for thought...

71. A Few ATSpeed Questions

Newsgroup: comp.sys.atari.st
Date: 1992-07-03 03:57:02 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1992Jul2.235702.23040@newstand.syr.edu>
Source record: 220210

I've come up with a few questions about ATSpeed for all you
ATSpeed users out there:
1. Anybody using AutoCad v. 9?
(I'm interested in whether or not it works)
2. Will programs that require a math-coprocessor (80287) work
with ATSpeed.
3. Is the ATSpeed system software interchangeable between the
8 and 16 mhz versions of ATSpeed?

Thanks very much for any input.

From what I can remember there is a Hardware hack that is required to get a faster clock rate to the MPF (MC68901) chip, but its stuck at that rate, unless you put in a switch....

For one thing you NEVER READ WHAT I HAD POSTED AT ALL, just glosed over,
I stated that I do know what the shareware fee is, do you...!!!

ZOO 2.1 the USA port is just a load of rubish, most Atari users that I know
can't even use it, the Z-Net BBS here has all its files in LZH201 format,
I for one state that its ZOO 2.1 that should be droped as its far to bugy and
hard to use, and has far to many limitations that LZH201 does not have...

Note: we don't have the latest Z-Modem or the latest Zip at all, so why the
reference that we have..???

From what I know Zip is now upto version 2.0 and Z-Modem is now 1990...

Roger..... sheppard_r@kosmos.wcc.govt.nz

They did a Vote on GEnie and Z-Net on archivers and LZH201 was voted for..!!

Well Bill, here is some more food for thought, you must provide a achiving util for the masses, ZOO 2.1 is not that at all, to bugy and to hard for a lot of users, and Has very severe limitations...

Please look further than your nose, there are a lot of types of people that use Atari computers, and you are only looking at a very small type of users, the Achiving util must be usefull for all types of uses, ie, disk drives only and it MUST be able to work with GEM, a lot of people buy the Atari because of the Simple GUI, so stop being selfish...

They did a vot on GEnie and Z=Net on the Archiver to use and LZH201 was voted for, need I say any more, you are out voted by some 100,000:1

How is the for ZLH201... using disk drives... a:\file.lzh B:\unpack\

This will unpack all the files/folder in files/lzh and create the unpack folder with all the suff within...

Try that with the USA version on Zoo 2.1...

Also Zoo 2.1 will crash with some types of ZOO files........

Roger.............. sheppard_r@kosmos.wcc.govt.nz

he is upto that rogering again...!!!

By the way as none of you knew this, Thomas Quester collects Stamps, and from memory that is his shareware fee, just send hime some stamps...

Ge you are a tight lot over there....

Roger......

There is a Pot inside to set this, these monitors must be warm before you do
this.

Its VR701 Horiz Centering, use a long plastic trimmer to do this, a plastic
knitting neadle will do, filed to a screw driver end....

NOTE: there are some 10 thousands volts (10,000v) inside this case to
please keep one hand in pocket...

|>
|> Thanks for any help.
|>

With respect to British Shareware, quite a lot of it can be registered through handling agencies, such as ShareWare Marketing. These do accept Visa and MasterCard. It is worthwhile writing to the vendors and seeing if they have an arrangement with such a company.

With Dutch and German vendors you will often find that Bank Account or Giro details are supplied in the documentation. Payment can then be made by doing a Dollar transfer to that account. The banks at the receiving end will do the transfer.

Within Europe of the problem has been solved to some extent by the use of Eurocheques, which are also accepted in a number of countries outside Europe. These enable one to issue cheques from your local bank in other currencies.

A possible solution is to send CASH by REGISTERED POST. All European Banks will accept Dollars, and in some parts of Europe DMarks or Dollars are prefered to the local currency.

Be careful about bank transfers to England. A couple of years ago I received a payment of $40 from the USA by bank transfer. After taking commission fees, transaction charges, and transmission reciept fees charged by the bank off the amount transfered, I ended up getting -$23.

In England, it is possible to buy Dollar Bank Drafts issued by American Express. These are accepted by most European Banks, and I would expect you could get them in the States also from American Express. I have in the past received Sterling and DMark bank drafts issued by American Express, but have not seen any of these for some time, so they may have gone out of use.

Hy,

> makes money or not. personally, i don't care if thomas questor becomes a
> zillionaire from lharc, so long as i can get 100% portable source from him,
> even if i have to pay for it. to my knowledge, that is not possible today
> for any price.

Since today, you can get the english version of LHarc V2.01l AND the
source-code for LHarc V2.01l (C & 68k, comments (not completely in
english)) from ftp.cs.tu-berlin.de (130.149.17.7, pub/atari/archiver
lzh201le.ttp & lzhsourc.lzh).

Everyone now can make his own Version, if he place in his own name and
change versionnumber and perhaps the name of the archiver.

Everybody happy?

Herwig

PS: The source is free since one or two month.

79. LHarc <-> Zoo

Newsgroup: comp.sys.atari.st
Date: 1992-07-03 07:16:56 UTC
From: monnier@disuns2.epfl.ch
Message-ID: <1992Jul3.091656@disuns2.epfl.ch>
Source record: 220196

Personally, I think there are two main differences:

- Zoo sources are more commonly available (although Lha is
also available in source (for Unix))

- LHarc has some more utilities: AFX, SFX, PFX

As I'm mainly a user, (and as my HD as shrunk from 46M to 26M due
to a hardware problem) I prefer LHarc which is faster on my ST and
which permits me to put 30M on my HD and still have some place to live !

It's a question of taste.

Source record: 220197

Hi,

I own a Atari 1040 STf machine and have the following problem: the machine keeps resetting when I boot it from diskette and when I just let it boot without anything it resets when I touch some disk icon on the desktop with the mouse and the whole sequence starts all over.
Before this there were problems with the power supple getting too hot but it went worse even though I bought a fan.
Has anybody else had experiences like these and do you know 'bout this f*****g problem.

Thank you.

Grabbed it yesterday (july 2nd), set it up this morning. The lib_v1.prg
worked well, but with th e cla prog. I also got TOS error 53.
This happened with TOS 1.04, Gemini 1.2 and NDVI 2.03

87. MiNT: How to suppress access to drives? (2)

Newsgroup: comp.sys.atari.st
Date: 1992-07-03 10:06:37 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <1992Jul3.100637.9963@unibi.uni-bielefeld.de>
Source record: 220195
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello world! (2nd try)

This is my second attempt to ask anybody if there is any information on how to prevent MiNT from accessing some GEMDOS drives: The idea is that if you run a multi-user system, you'd probably like some users not to access some data. One problem might be, that the ST can only run one GEM, but what if a remote user calls it too? On Minix partitions you can set the access permissions so that stuff like this will never happen. But there will be the entries in drive U:/ left which can be accessed by anybody. Is there any way to prevent MiNT from recognizing these drives or any other way to make them not occur in drive U: or to make then not accessable by all users? Patching the _DRVBITS system variable works fine, but how should MiNT load the minix partition driver, if its own boot partition c: has dissappeared?

Any ideas? I'll appreciate them!

> to be erasive. I used several termcaps, including the one that comes
> with crssrc12.zoo, and tried both tos and mint but to no avail. Ideas?

On the ST, TAB is destructive. Curses assumes a non-destructive TAB. The fix
is to remove the TAB capability from your termcap entry.
BTW, this is not a bug. The TAB capability is really only usable with terminals
that have a non-destructive TAB (that's why it exists in the first place).

Hatari!

> Most programs running on a TT which use the serial/modem ports use the particu
> r
> one selected by the modem CPX.

No. Most programs have a kind of popup to select the right port. Just
look at such programs like rufus, connect, etc.

> My question is: Is there some way (I'm sure there is) to change what the sele
> ed
> port is (e.g., with GFA Basic) without calling up the CPX?

There is a very simple way: take Bconout and Bconin, (XBIOS-Calls), they
allow you to choose the port, you want the datas going out.

I think (I don't have a book here, sorry) that the numbers where:

Bconout(5,byte) = MODEM1,
Bconout(6,byte) = MODEM2,
Bconout(7,byte) = SERIAL1,
Bconout(8,byte) = SERIAL2.

Maybe the numbers where from 6-9, if you don't have any papers about
this, send me an Email, I will look for it.

Remember, that this will only work on a TT, if you use this on a ST
you will get many bombs...also vice versa!

> Also, I have a serial printer, and with the printer set to the modem port, a s
> een
> dump ALWAYS goes to Modem 1, no matter what the CPX is set to (though other ou
> uts
> go where I want them). Is there some way to change this?

Well, best thing to do is to take a spooler, which allows you to choose
the port, the data should go. Or try to use the parallelport or the
SCSI, some printers can do so.

> This would all be quite helpful to know, since I have three deviced currently
> oked
> up to serial ports (modem, printer, roommates's computer).

Well, I also need 3 of my 4 ports: modem, terminal to a NeXT and
sometimes a second modem ... :)

Greetings, Roland.

A netter asked if anyone used Joppa's FAX software. I have the send only version (do not want to leave my system on line for the receive function) and I think the software is GREAT. For the Atari dealership that I run, it has been a terrific tool for reducing costs (send FAXes at discount times).

I highly recommend the product.

>for the masses, ZOO 2.1 is not that at all, to bugy

I'm using ZOO 2.1 a lot on various UNIX boxes, on VMS machines, and,
oh yes, on my Atari. I haven't found any bugs yet.

>and to hard for a lot of users,

You seem to say that having to choose from "-add" and "a" for adding
and (Horror!) from "-extract", "e", and "x" for extracting files is
too hard vor the mass of Atari users. In this case, I must be a very
exceptional Atari User. Oh, well...

> and Has very severe limitations...

Such as?

[...]

>They did a vot on GEnie and Z=Net on the Archiver to use and LZH201 was voted
>for, need I say any more, you are out voted by some 100,000:1

So let me put in my vote for ZOO.

When I was still running ZOO 2.01 on my Atari and came across an
archive which could not be unpacked with it, it politely told me that
I needed ZOO 2.1 to unpack it. Got it from the nearest server, and voila...

In contrast, I've spend hours wondering whether LZH archives were
corrupted or whether I was using the wrong LHA version, and more
hours figuring out which the latest version is and which server
carries it.

This is ok if you are having fun keeping up with the latest software
releases and if you enjoy spending a lot of time upgrading your Atari.
However, it's far from ok if your main purpose is to get some work
done with your machine.

>How is the for ZLH201... using disk drives... a:\file.lzh B:\unpack\

>This will unpack all the files/folder in files/lzh and create the unpack
>folder with all the suff within...

>Try that with the USA version on Zoo 2.1...

Creating b:\unpack first, making it the working dir, and then unpacking
a:\file.lzh is probably too much to ask...

(This will work with the ZOO 2.1 I use, I doubt that there is a
different USA version around.)

95. Zoo & Minix partitions

Newsgroup: comp.sys.atari.st
Date: 1992-07-03 14:02:36 UTC
From: sundsted@cis.uab.edu
Message-ID: <1992Jul3.140236.13586@cis.uab.edu>
Source record: 220208

Does anyone know of the existance of a Minix (extended filename)
compatible version of Zoo. I have been using Zoo 2.1 for some
time now, and it works perfectly, except for the fact that it is
limited to TOS 8+3 filename. Without the UNIXMODE variable set,
it simply truncates filenames, with it set, it creates the .dir file
even on Minix parititions which can handle long files names.
Obviously, there is no need for the unixmode business on
a Minix file system. Hense, my question...
Thanks for the help!

Source record: 220214

Hello, it's me again!

Can anybody help me this time. A few months ago about half of the keyboard (from the diskdrive side up to about f and g) stopped working. I got a bit worried about this (BTW the keys that stopped working varied from time to time but it was always around the same area) anyway, back to the story.
I was just about to take it into the shop where I bought it. BUT it was OK when I went to pack it up.
Seeing as it started to work again I forgot all about it. A couple of weeks ago it did it again. This time I took it to the shop straight away. After a week I got it back and it worked. The reason why it stopped according to them was a switch on the mouse being in the wrong place and locking up the keyboard. This sounded a bit dodgy to me, simply because my mouse hasn't got any switches! It has worked OK up until now.
This time I got a bit mad and shook it around a bit. To my surprise it actually worked properly. I don't really want to keep doing this though.

So basically, has anyone got an idea about what is going on and what can I do about it?

Thanks for any help (and any help you might have gave me about earlier questions

From the Holy Book of <1992Jul3.061400.4984@peponi.wcc.govt.nz>
as spake by sheppard_r@kosmos.wcc.govt.nz :
>Well Bill, here is some more food for thought, you must provide a achiving util
>for the masses, ZOO 2.1 is not that at all,

Oh really? Here's some food for thought for _you_, Roger:

- Of the ~250 GNU packages on atari.archive, over 150 are .zoo's. Most
of the rest are .tar.Z's. Three are .lzh's.

- Of all the MiNT-related packages on a.a (many by Eric Smith himself),
most are .zoo's. _Two_ are .lzh's.

If such high-profile figures as these use Zoo almost exclusively, it
can't be as bad as you make out.

> to bugy

Name one.

> and to hard for a lot of
>users,

If typing 'x filename' in a parameters dialog is too difficult for you,
Roger, I suggest you move to the Mac.

> and Has very severe limitations...

Name one.

>Please look further than your nose, there are a lot of types of people that use
>Atari computers, and you are only looking at a very small type of users, the
>Achiving util must be usefull for all types of uses, ie, disk drives only and
>it MUST be able to work with GEM, a lot of people buy the Atari because of the
>Simple GUI, so stop being selfish...

Zoo runs from the desktop as well as anything else. And I had no
problems with Zoo before I got my hard drive.

>How is the for ZLH201... using disk drives... a:\file.lzh B:\unpack\
>
>This will unpack all the files/folder in files/lzh and create the unpack
>folder with all the suff within...
>
>Try that with the USA version on Zoo 2.1...

Trivial. You can even do it from the desktop:

- Open a window on the directory that contains ZOO.TTP.

- Open a window on B:. Create directory UNPACK and open it.

- Hold the right mouse button down while left-double-clicking on ZOO.TTP. In the parameters dialog, type 'x a:\file'.

Too complicated for you, Roger?

>Also Zoo 2.1 will crash with some types of ZOO files........

Never heard of this.

Roger, have you ever, _ever_ seen an article saying "Hey, has anyone managed to unpack frobule.zoo? I've tried five different versions of Zoo and none of them work."? I see LHarc complaints in this vein at least once a month. Why do you think this is? I've downloaded literally hundreds of .zoo and .lzh files from a.a and have _never_ found a .zoo file I couldn't unpack; .lzh files, on the other hand, give trouble as often as not. I can also unpack and manipulate any .zoo archive here on my Unix account just as easily as at home; try that with LHarc (though with any luck the recently-released lha 1.00 sources might take care of that).

Face it, Roger, Zoo has virtually identical functionality and compression ratio to LHarc, is just as widely available and infinitely more standardized. Stop whining.

102. How does XBIOS 16 do it?

Newsgroup: comp.sys.atari.st
Date: 1992-07-03 16:43:22 UTC
From: paetau@mits.mdata.fi
Message-ID: <1992Jul3.164322.8314@mits.mdata.fi>
Source record: 220006

I've done a little program that switches between the normal keyboard layout and a self-created (with Simon Poole's) layout. It uses ALT-HELP to switch between these two keyboard layouts, and the routine that does the switch uses XBIOS 16 and XBIOS 24 to do the switching. However, I've heard that it's not wise to use GEMDOS/BIOS/XBIOS calls from within a interrupt routine, and I have been getting bombs every once in a while, especially if I hold ALT-HELP down for a few seconds. I'd like to know if it's possible to switch between two keyboard tables without using XBIOS calls. So please anybody who knows about this, tell me how it is done!

>> Well I don't know Notator but you probably can run it from floppy.

>You can. It will take a while to load off the floppy, but once it's in
>memory, it never uses the disk except to store and retrieve user files.

True indeed, and I used it in this manner for quite a while. I had 1Mb total, which meant that as the version numbers of Notator crept up, the free memory went down :-(and when we reached 3.1, I upgraded my ST to an STE with 4Mb. (After an unsuccessful attempt to use a third-party memory product).

What I do now is to load the whole thing on to an "RDE" ramdisk which loads from floppy in about 20 seconds. Notator loads from the ramdisk in about 5 seconds. You could blow away the ramdisk copy of the Notator programs, but with 4MB total, I've not had to.

Harddisks are bigger and permanent, but ramdisks are so *quiet* :-)

RDE was posted to comp.binaries recently; the files it makes are executable, and you just run them to create and load the disk - superb program! I also compress the executables to get >1Mb of junk into my machine at boot-time.

>Is there some place I can get decent documentation (none comes with it)?

The TT is not compatible with the ST Xformer. I did make a TT version which never got released because I was disappointed with the speed. You actually got better speed running ST Xformer on a 16Mhz ST (like a Mega STE) than running on the TT's 68030. Figure that out. What's worse is that the PC version running on a 386SX is even faster than the TT. It's due to the fact that the TT is really a 16Mhz machine, not a full 32Mhz machine as some would have you believe. A 16 Mhz 68030 is not that much faster than a 16 Mhz 68000, and due to the changes required to make it run on the 68030 it actually ran slower. So don't lose sleep over it. Of course, I did post the source code to ST Xformer 2.55 up to the boards about 3 years ago, so feel free to hack away at it. I doubt there's much that can be done to it.

As for documentation, there is the manual for Xformer. Most of the PD mail order places that sell the Xformer disk should also be including the manual. If you can't find one, send me a small bribe to cover return postage and I'll send you one.

While that's true that we shouldn't build up false expectations, Jim Allen did indeed say on GEnie what Dave Curtis mentioned above: that the Falcon can be upgraded to 50Mhz and about 1200x900 res without too much trouble or expense.

Nonetheless, I don't doubt what Jim Allen has said, but I also agree that we should kept cool with our expectations. Just wait until you can buy them, and then you can go wild, all right? :^)

112. More AT-Speed Questions

Newsgroup: comp.sys.atari.st
Date: 1992-07-03 19:33:03 UTC
From: dtarico@violet.ccit.arizona.edu
Message-ID: <1992Jul3.123303.1@violet.ccit.arizona.edu>
Source record: 220223

Does anybody have a newer version of the AT-Speed C-16 system software than ver 3.02? I know that a version 3.5 was put out, but I'm not sure if that is the latest. Where can the newer versions be obtained?

Also, does anybody else have trouble with the CGA screen colors? When I run things like the Norton utilities, the screen colors are weird, and it makes the software difficult ot use. For example, to select options in some of the programs, you move a colored bar. But under AT-Speed, the bar doesn't show up, or the text is the wrong color, etc. Under PC-Ditto, the colors are just fine. Is this a problem with my setup or with the way AT-Speed handles color?

Any info would be appreciated. Thanks.

In article <1992Jul3.054035.4581@peponi.wcc.govt.nz> sheppard_r@kosmos.wcc.govt.nz writes:
>ZOO 2.1 the USA port is just a load of rubish, most Atari users that I know
>can't even use it, the Z-Net BBS here has all its files in LZH201 format,
>I for one state that its ZOO 2.1 that should be droped as its far to bugy and
>hard to use, and has far to many limitations that LZH201 does not have...

frankly, roger, i find this very, no EXTREMELY hard to believe since there
are many users of zoo 2.1 who have zero problems with it, myself included.

what happens on znet or any BBS has little to do with usenet.

if you consider zoo buggy, let's fix it. please post (or send me) a list of
what you consider to be bugs. there may very well be actual bugs in the
code (i know there are serious bugs in lha2.01i). note that i do NOT propose
we all go out and fix zoo. so i will volunteer to examine your list, see if
i can duplicate it, and fix the code as needed. but please be very specific.
same for your list of limitations. the fact that there are probably 100's
if not 1000's of users running the GNU C compiler, MiNT, and other interesting
software, all posted with zoo 2.1, means that it can't be nearly as bad
as you perceive it to be. [i actually suggest you post this since i use
only a tiny subset of zoo's capabilities, and only from a command shell
and only with a large hard disk, etc. there are others who can round out
the review team.]

i also hope you are learning to understand what we consider to be portability
issues. many (most?) of us read usenet from non-atari computers, grab posted
things, and want to examine them BEFORE we spend hours of time downloading.
this wastes both time and money. that is why we want to use an archiver that
offers portable source code. that is why we want either tar or zoo. it has
absolutely nothing to do with shareware, people getting rich, cute features,
ease of use or any other peripheral issue. it has EVERYTHING to do with
basic ability to share data with others and with dissimilar systems, no
matter whether it is considered easy to use or feature-rich. as long as it
works. that is step one. zoo is at least at step one. lharc is not in the
opinion of many of us.

i would suspect that many zoo/tar users are developers (producers). we are
the ones who write the software that users (consumers) use. as such, and
especially with the producers who post free code here, we can derive some
power base by electing to use our own "proprietary" scheme distributed
amongst ourselves and thus cutting out the non-producers of free software.
it does not make much sense to raise our dander! :-) in other words, "look
before you leap". [note that i do NOT propose this, but this is just an
example of how extreme things can get if we don't use portable tools.
we actually did have partial experience with this since non-atari owners
could not unpack lh5 archives for a time. thus lharc posters were in fact

discriminatory against non-atari users, though all usenet newsgroups are meant for everyone. doing this is just not in the spirit of free software development which i doubt anybody has a serious problem with.]

i would suggest, however, that freeware developers stick with zoo. commercial and shareware authors need to make their decision based on marketing considerations (ie i they don't want to p*ss off prospective customers). fortunately, freeware developers (who expect no payment other than user satisfaction, if users are saavy enough to appreciate their tools) do not have this "problem". you get (at least) what you pay for...

another thing to consider are the less vocal "lurkers" in this newsgroup. the silent majority. the one's that read this and shake their heads. the ones that don't even read these diatribes since they kill anything related to lharc, zoo, archiver, sheppard, and rosenkra. :-)

>Note: we don't have the latest Z-Modem or the latest Zip at all, so why the
>reference that we have..???

don't understand you here. there is a portable unzip program that was posted to comp.sources.misc or c.s.unix. there are portable zmodem programs, too.

>They did a Vote on GEnie and Z-Net on archivers and LZH201 was voted for..!!

means nothing on usenet...

first things first. we must get the basics working, then go on to add features. let's not put the cart before the horse, however. IMHO both zoo and lharc can fill the bill, eventually. i (and many others) believe that zoo is already there and lharc is not for some very rational reasons. if you think zoo is bad, let's see what you mean and try and fix them or educate if there are just misunderstandings.

115. 50Hz on a color monitor, how?

Newsgroup: comp.sys.atari.st
Date: 1992-07-03 19:48:45 UTC
From: automan@milton.u.washington.edu
Message-ID: <1992Jul3.194845.8319@u.washington.edu>
Source record: 220221

Greetings Netters!

First let me say thanks to all those who responded to my questions about
Supra Hard Drives and TOS 1.98.

The Supra is working perfectly, (thanks to Dan Alwayrd) and after extensive
therapy (and flames, slams, etc) I now believe I have TOS 1.62.

My next problem is that I have downloaded Dynamite and some other great
demos, but the screen starts rolling uncontrollably after I run it.
I am sure this has something to do with the frequency, but after running
50hzswap or using control panel to config monitor for 50hz, I still get
the rolling screen. Do these programs only work on monochrome monitors?

Thanks in advance,

Roger Mcghee (automan@milton.u.washington.edu)

well, this is at least a step in the right direction...

>Everyone now can make his own Version, if he place in his own name and
^^ NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO
NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO
NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO,NO
>change versionnumber and perhaps the name of the archiver.

...but this reverses the direction again! this is how it all started in the first place. sheesh...

if i read between your lines, i believe this is a sarcastic remark. note that everyone has access to zoo 2.1 but there are not a zillion (public) versions. and you may find this hard to believe comming from the likes of me, but i actually think thomas q has HELPED the lharc situation by eliminating the massive confusion that existed (now there is only massive confusion for newcommers and frustration and disdain for zoo pundits).

and i realize that in order for him to do this, people needed a compelling reason to use his version. that reason was speed. hence the assembler. however, this was also his basic mistake since only the ST is well serviced, not the rest of the world. fortunately i can sit here with 20-20 hindsight and say "he should have kept the C code he started with on track with the assembler and freely distribute the (slow) C code, and shareware the asm".

i also suspect that some of the people who cry loudest when someone knocks atari or speculates on its demise, are the same who laud lharc (and may even be into the fancy desktop things -- the GEMsters :-). in essense, this tends to orphan the ST from the rest of the world (ie non-open system which it is already) and in fact contributes to its death. those of us who screech about the superiority of zoo are in fact helping the atari into the mainstream. it could be argued that nothing has helped this happen more than GNU C and MiNT. as much as the GEMsters may cringe, these things turn people on to a reasonable, inexpensive, unix-like environment (which is important to an awful lot of us) because now all the tools from unix are now almost trivial to port. these and other key tools, which also happen to be free and centrally supported, have turned out to be crucial in this respect.

look, i suggest that we either 1) totally ignore lh* and use zoo, 2) use
the portable lha 1.00 (unix), or 3) let thomas questor coordinate development.
the last thing we need is 50 more of "his own Version" floating around.

i have a feeling we are just not getting the point across for some reason.

thus i propose a split of this newsgroup into:

comp.sys.atari.st.i_like_lharc
comp.sys.atari.st.i_like_zoo

i had considered other alternatives... :-)

>Everybody happy?

grrrr...

Date: 1992-07-03 21:15:53 UTC
From: rosenkra@convex.com
Message-ID: <1992Jul03.211553.7832@convex.com>
Source record: 220229

let's continue this offline. no sense in the rest of the world seeing this :-)

however, since it's a holiday (here) let me comment on two things:

Roger, you're just bein' you when you say:
>Please look further than your nose
[...]
>They did a vot on GEnie and Z=Net on the Archiver to use and LZH201 was voted
>for, need I say any more, you are out voted by some 100,000:1

the issue is usenet and public FTP sites, not private/commercial BBSs. they can do what they want. as long as my tax $$$ support the internet, and being a resident of michigan (hence supporting umich.edu with state taxes), it should be used in a proper fashion. there are rules here. if anyone has a right to impose things, it's us here. personally, i don't want to impose anything. i want to remove constraints.

you see, my vision extends further than you think, even to NZ. :-)

>there are a lot of types of people that use
>Atari computers, and you are only looking at a very small type of users, the
>Achiving util must be usefull for all types of uses, ie, disk drives only and
>it MUST be able to work with GEM, a lot of people buy the Atari because of the
>Simple GUI, so stop being selfish...

i am only considering readers of comp.sys.atari.st[.tech]. i don't know how many 10 year old kids own atari STs for games or whatever on Genie.

if you insist, i invite you to prove your position. whenever i speculate, i say so ("i suspect" or "probably" or "more than likely", etc). i don't have a specific demographic profile of our readers. i can _guess_: college students and professionals would probably account for 80-90%, 50-50 color-mono, 60-40 hard disk/floppy-only, 25-25-50 GEM-only/cli-only/both, >50% have TOS 1.4, >50% have >1MB memory, etc. reasonable (for usenet not ACME BBS)? do you have a better guess or (even better) real stats? remember, we are not talking about ALL atari owners, just readers of this group. there are some readers here who don't even own an atari. do we prevent them from getting "our stuff" by forcing them to buy an atari to use a program which can only be compiled/run on an atari? ask them. remember this is a tax-supported, public forum. not a commercial BBS.

>Also Zoo 2.1 will crash with some types of ZOO files........

send them to me...

>Ge you are a tight lot over there....

ok, three things...

i am afraid it is not only cranky, overstressed yankees that feel the same way. there are cranky, overstressed germans, canadians, and dutch that i can recall expressing a similar opinion. perhaps the isolation-induced parochialism afforded by the Pacific is what we need. maybe its the difference in hemispheres? (reminder to me: think of this next time i flush...). maybe it's all those bleeting sheep you have. :-)

> gather (from the file itself, since I couldn't make sense out of the
> documentation) the program supports 38400 baud, 72600, and 15600 baud.
> Is this true and will it work?

it will work. the speed will be set at 38,400, but the computer
will lose characters at that speed. i know because I've used the
accessory you're talking about with my USR DS HST modem, which
seemed to report 38,400 as the port speed, but characters would
get lost, and garbage was all over the screen.

if perhaps you have a 16+ mhz ST, you might be able to get it to work.

i have tried one of these hardware patches . It doesn't work unless you
have an accelerator. It works fine for uploads, but lots of CRC's and
other errors for downloads. The standard ST is simply not up to the task.

Adam.

Come on Bill get with it, just must support the masses, and I don't think you are the masses...

I have used ZOO 2.1 USA many many times and have big problems with it, some types of ZOO files would not unpack, this is because of a known bug, and confirmed by the Author, and it does not do extract redirection easly when run from a TTP, and will not create added folders, these must be created before..

Is assembler to hard for you Bill :-)..

Come on Bill lighten up and go with the wind or break as they say...

By the way why not try LZH201L when you get it..:-), you might even like it..! it has the new PFX/AFX inside it...

>types of ZOO files would not unpack, this is because of a known bug, and
>confirmed by the Author,

Is this known bug so serious that the Author can not possibly ever fix it? Would fixing this bug render utterly and totally incompatible with previous versions of itself? (I ask this seriously because known bugs in any program are a problem. I look forward to a thoughtful answer backed up with documentation.)

(I have heard something of a bug involving timestamping, so that you might run into trouble if TZ is set improperly. Is this what you're talking about?)

> and it does not do extract redirection easly when run
>from a TTP,

don't know about this one.

> and will not create added folders, these must be created before..

I have archived directory trees with Zoo on a Un*x machine and on my ST. It saves paths to files and recreates the directories when I unarchive with no intervention on my part. I don't have to recreate the directory structure ahead of time. It does it for me while extracting files.

Perhaps there are variants of Zoo 2.1 after all... :-)

My own personal take on the matter is that I couldn't care less what archiver becomes "the standard" for the ST as long as it also has a fully compatible Un*x version. (Ideally, of course, portable source should be available so it can be on any platform.)

My rationale is simple. Before I decide to download anything to my ST, I would like to know what I am downloading.

seek enlightenment elsewhere, friend...

>(I have heard something of a bug involving timestamping, so that
>you might run into trouble if TZ is set improperly. Is this what you're
>talking about?)

this is really something related to different GNU libraries. i have
allan pratt's original port of RCS. it likes TZ to be :EST5EDT while zoo 2.1
prefers EST5EDT. both are POSIX compliant as i read it. i assume it is because
of the 6-12 month diff in compile dates (hence lib versions). it is more an
annoyance than a bug if you use both (i do). i suppose i should just
recompile both with the same lib and fix it. at the moment, i just alias
zoo to 'setenv TZ EST5EDT ; zoo21 \!* ; setenv TZ EST5EDT' and all is
well.

the code that has the bug with timestamping is actually lharc <=2.01i.
on TOS < 1.4, it does not (by default) preserve timestamps (like virtually
every other archiving system available). i am not sure if there is a
switch to override this. of the docs i have, the ones in english only
mention timestamping in context of comparing 2 files (ie should i add/extract
a file to/from an archive if it is newer or should i reset the timestamp
of the archive itself). i can't find anything talking about if the file
in the archive is dated x and today's date is y, should i make the extracted
file's time x instead of y. lha will make it x (as will zoo, GNU tar, arc,
etc). lharc 2.01i and earlier seem to make it y (today's date). note that
i really mean date/time. this behavior may be limited to TOS 1.2 and earlier.
i run TOS 1.2 on my mega. (i also have the TOS 1.4 roms, tho i have not
installed them. this is NOT the solution, anyway.)

now that i have the unix version for lha 1.00, this is moot anyway until
lharc changes format on us again. thanx, BTW, to the people in germany who
pointed me to this code. i uploaded the original to atari.archive since i
did not find it there. i believe the file is lha-1.00.tar.Z. compiled on
the ST with gcc -O (so far) it seems to extract just as fast as LHarc but
is 1.7x slower on archive creation. if i have time, i will look into this.
the diffs, BTW, are trivial. if anyone is interested, i will post them
when i look into the performance issue. i suspect that lha should run as
fast as zoo on archive creation. in that case it will be only 10-20% slower
than LHarc, but the source will be portable. i suspect that whatever
features from LHarc that are missing from lha can be suitably #ifdef'ed
and backed into the source so it will remain portable to unix/VMS/MSDOS/etc.

there is really no need to convert the LHarc assembler to C now.

i you can't wait for the diffs, look at lharc.h and util.c. the header
had the "rb" and "wb" macros commented out. should have been #ifdef'ed
(i used #ifdef FORCEBINARY). i built with MiNT libs at PL 19. does not
have ftruncate(2) so must -DNOFTRUNCATE. in util.c, find the ifdef dealing
with NOFTRUNCATE (#if defined(NOFTRUNCATE) && !defined(_Minix)) and add
this to the end: && !defined(atarist). this will eliminate code for rename(2)
which mint .olb has. the only other thing i remember is -DSYSV_SYSTEM_DIR is
needed. somewhat of a misnomer since this is really POSIX. i could not get
the nested make to work, so i built a script. oh, you probably need
-traditional, too. i did not need any code changes on a 4.3BSD/POSIX system.
just -DSYSV_SYSTEM_DIR and a switch for pcc. nice implementation. it came
from the japanese guys. near perfect so far (tho not really ANSI/POSIX)...

ciao

> the first place. sheesh...

There are ever two sides... I think its a good idea make the source free available, so everybody can add his own features. I don't think, that many people realy want make her own version. Take a look at zoo: there are only 3 or 4 people working on the Source.

> look, i suggest that we either 1) totally ignore lh* and use zoo, 2) use
> the portable lha 1.00 (unix), or 3) let thomas questor coordinate
> development. the last thing we need is 50 more of "his own Version"
> floating around.

Point 3) is what Thomas Quester offered in the README (but only in german, I think...), so that will be the best choise before offering a own version!

Programers can contact Thomas when they have a good idea for LHarc that would be interesting for everybody. (MausNet: Thomas Quester @ HH2, from Internet Thomas_Quester@hh2.maus.de should work.)

Well, I hate to disagree here (;^) but I only have a colour monitor and have
been using Notator with it since early '89. No real problems. Sure, it's a
bit scrunched up, but I haven't had a real job since the end of '88 and can't
afford a mono monitor yet, so I'm not complaining. It starts it up in black and white and
it stays black and white after exiting too. One thing I found I had
to do was turn the brightness and chrominance levels way down to get a useable
screen colour to work with.

Speaking for me and my experiences,

Shane.

> from a TTP, and will not create added folders, these must be created before..

This is true: There is one known bug in the original ST release of
ZOO 2.1 that crops up in rare circumstances when unpacking ZOO 2.0
archives. Bill Schroka fixed it and send me a copy of the fixed
binaries, but so far as I know, he never publicly distributed the
fixed version.

I've seen the ``won't create added folders'' complaint several times,
and unless I misunderstand the reference, it's either misinformed or
silly. ZOO *will* create folders as needed to house the files in the
archive. If you want everything placed in some newly named folder, of
course you have to create it yourself. I don't see why it should be
considered harder to create a base folder using the GEM Desktop than
by passing some obscure command switch to LHARC.

> By the way why not try LZH201L when you get it..:-), you might even like it..!
> it has the new PFX/AFX inside it...

... But Roger still doesn't get the message. LZH201L won't run on a SPARC,
VAX, NeXT, Iris, Pyramid, or Apollo. That is not a good situation.

If the recently unearthed Unix LHA sources prove to be portable,
reliable and compatible, that may be a partial solution. (The problem
of LHARC screwing up timestamps still needs to be fixed.)

This discussion has been going on for months...

How about this as a settlement:

People may pack their binaries&doc in whatever format they like.
((zoo|lharc) & arc) preferred.

People are encouraged to archive their sources with ZOO as the chances
that zoo will be available on future machinery is somewhat larger than
for any of the others.

People ought to split cleanly between sources and documentation.

I have been using Notator 3.0 since early '91, originally with a colour monitor, and for the most part agree. However, the problems I encountered were with the score printout. On a colour monitor, the score printouts will contain some missing note heads and stems. (I have a 1040 STe with 4 meg, Syquest 44 hard drive, and print to a DeskJet 500). After switching to a mono monitor some months later, the print out was perfect. It was explained to me, that Notator uses a screen dump to print, and the colour monitor definately was NOT recommended.

My suggestion is to go ahead and use the colour monitor for sequencing, as it works just fine, but for notation scoring, a mono monitor is a must.

Notator IS a great program!!

We must be talking about different programs...

I agree with Bill Rosenkranz that this discussion is going around in
circles. However, it's my impression that you keep repeating rather
sweeping or even wrong statements about ZOO in order to turn people
away from it. As long as you do that, I take the liberty to contradict
your statements.

I have obtained ZOO 2.1 from the server rusmv1 in Stuttgart, but it
should be identical to the one available from a.a. As stated before, I
have used it heavily on a rather heterogeneous set of machines.
- I have NOT found any serious bug,
- I have NOT encountered any archive which I could not extract, or
which gave me trouble in any other way,
- ZOO 2.1 does create the directories it needs for unpacking (this can
be disabled, though).

And just what do you mean by "extract redirection"??

>Point 3) is what Thomas Quester offered in the README (but only in
>german, I think...), so that will be the best choise before offering a
>own version!

i hope thomas does offer to coordinate lharc. he appears to be the most knowledgable about it and well known to this newsgroup. he should also consider lharc in a larger context and do his best to satisfy all needs if possible. a 100% portable C version for CLI use has to be the lowest common denominator. i suspect that anyone with a telephone can get a CLI. being able to deal with systems with only
a single drive is necessary, tho you should realize that more and more people have hard drives. consider the expansion in memory from 8KB to 4MB. note that larger context includes other operating systems (especially MS-DOS, Unix, and VMS), various ST configurations (i don't think he should have to worry about "foreign" system peculiarities), user's language, etc.

he should also consider writing in C with a decent compiler. asm has to be a pain to program. "modern" compilers like gnu C generate pretty good code, all things considered. and this gets better all the time. asm is asm. there are no advances. that is the limit. other archivers are already within 20% of the speed of LHarc. consider this a trend.

>Programers can contact Thomas when they have a good idea for LHarc that
>would be interesting for everybody. (MausNet: Thomas Quester @ HH2,
>from Internet Thomas_Quester@hh2.maus.de should work.)

i think it might be appropriate to send him code as well. ideas are great but code saves dev time. i'll leave it up to thomas to figure out how to handle this. i'd recommend starting with freezing a recent LHarc release in both asm and asm converted back to C. add features to both concurrently. or abandon the asm if he gets a decent C compiler. have the code submissions diff'ed to the C baseline. odds are all that will be added are features. note that the C baseline should be portable (no GEM, bios, etc unless they are #ifdef atari or something). he might find it helpful to contact someone like the zoo author (rahul dhesi (sp?)) for sage advice.

if he needs/wants the GNU C compiler/libs, i'll be glad to mail him floppies of much of my dev environment...

ciao

>My next problem is that I have downloaded Dynamite and some other great
>demos, but the screen starts rolling uncontrollably after I run it.

>Roger Mcghee (automan@milton.u.washington.edu)

This is probably due to that the demos often sets the refreshrate to 50Hz
(european demos). They often do this because if they for an example wants
to 'open the borders' they change the refreshrate between 50/60/71Hz in
a special way. There is only one thing you can do, if your monitor can't
handle 50Hz and that is to adjust it so the picture stops rolling.

Thats were it came from, its a solid as piece honey comb, try using it with one or two disk drives from the TTP...

And it fails on some types of archives....

I will stick to LZH201 as all otheres have here in NZ...

Roger..... sheppard_r@kosmos.wcc.govt.nz

Well LZH201 will redirect extraction just like this...

a:\file.lzh b:\unpack\

No funny switches use here, is there, and it extracts to the b: drive and
creates the unpack folder, zoo2.1 does not do that at all..??

It's more likely just a matter of a minor vertical hold adjustment on
the back of the monitor (you may have to reach in withan adjustment
tool of some sort...) to get your monitor to be stable at both Hz
settings.

>it got lost:-).
That's TOS 1.04 (or 1.4 in the old, wrong fashion)

>Also, what difference does the version of TOS you have make?
Hmm, 1.00 is absolutely buggy, 1.02 has less bugs but working RTS/CTS, 1.04
is really stable (especially when hard disk are used) much faster but has
no working RTS/CTS, TOS 2.XX and 3.XX contain the new desktop (3.XX only for TT,
2.00-2.05 only for Mega STE), TOS 2.06 works on Mega STE and all other STs,
has the new desktop, less bugs (there are some really anoying ones) and working
RTS/CTS.. the best choice for any 68K-Atari except TT...

>use windows, but in the ATARI-DESKTOP I still can open only 4
>windows.
Blame Atari for it, the desktop doesn't use normal system calls (via trap)
but jumps directly into the routines. So there's no chance for more than
4 windows in desktop except....

>Is everything the way it is supposed to be (still only 4 windows in desktop),
>or do I have to change something ?
Yeah, get WINX 2.0, it offers 40 windows within the desktop, control elements
in all window (not only the topped one). The only problem is that you've got
to copy the whole GEM into the RAM in order to give WINX a chance to patch it.
That shouldn't be a problem on a 4 MByte machine like yours or mine, but the
512 KByte or 1 MByte are going to get some trouble....

I guess it all boils down to this:

The convenience of being able to do "redirect extraction" (LHARC) vs.
the convenience of being able always to use the *exactly* the *same*
archiver across many platforms (ZOO).

I realize that a portable version of lharc is available, for now.
Until someone coordinates development of lharc, that could get
seriously out of sync. I, like others on the net, think that the best
choices for a coordinator would be Thomas Questor or the originators
of lharc, who could release the portable source. Then if Thomas
Questor wished, he could make a version optimized for the ST and make
that shareware, or a commercial product or whatever else he might
wish.

Also, it doesn't sound too hard to add "extract redirection" to Zoo.
(It certainly is easy enough to "emulate" this manually. :-))

In any case, if Lharc development were coordinated, then both Lharc
and Zoo would be consistent across platforms, and people could simply
choose which ever archiver they have a preference for (religious or
otherwise) and know that anybody who wishes to unarchive will be able
to do so with a minimum of hassle. I think this solves everyone's
problems and stops this waste of bandwidth.

Does anyone have access to Thomas Questor?

(BTW, Roger is half right, screwing timestamping is a TOS (not GDOS)
problem that Atari fixed with TOS>=1.4)

i could not let this pass :-) i give you the following out of context
quote of an out of context quote (form obstack.h) (and yes gcc-ld does
dynamically create everything):

One motivation for this package is the problem of growing char strings
in symbol tables. Unless you are "fascist pig with a read-only mind"
[Gosper's immortal quote from HAKMEM item 154, out of context] you
would not like to put any arbitrary upper limit on the length of your
symbols.

appropraite huh!!

cheers,

>tos 1.2 and 1.4 from memory, may be Thomas Quester does not have TOS 1.2 to
>test this out on..??.

what does GDOS have to do with this? or do you mean GEMDOS?

this is what i'd call a serious bug. timestamps are part of the data and
integrity is thus compromised with this program on TOS < 1.4. this program
is not even portable across the ST let alone beyond. the more i hear about
this program, the less i like its basic design. it overlooks the basics.

i will grab the newly released src and see what i can do. however, if i
don't have the particular assembler that TQ uses, it will be excruciating
to change anything, let alone compile. this is near-trivial if it were in
ANSI C with POSIX bindings. with C you can have all the features you
want/need, it will run no more than 20% slower, and it will be portable.
what roger fails to understand is that there are as many source formats
for assembler code as there are assemblers. for example, if this code is
written with assembler macros, and your assembler does not support them,
conversion is difficult at best. i have the following assemblers: madmac,
gas, as68 (alcyon/DRI) and a few PD ones. is LHarc written with any of
these? it would be helpful to know before i waste my time getting the src.

Good question, Doug. Let me take it one step further:
Where does one turn for "official" info about the upkeep of
ATSpeed in the states? Is there a place? or is the net still
the BEST place to turn to?

>BTW, this is not a bug. The TAB capability is really only usable with terminals
>that have a non-destructive TAB (that's why it exists in the first place).

I don't think that would help. I've scanned the curses/termcap code
and found out that if no tab character is specified in the termcap
file (ta-entry), curses assumes the '\t'-character. The only
condition on which curses doesn't output tabs is when the tty-mode
indicates that tabs are replaced by spaces on output, namely when
XTABS is set in the tty-flags. It seems that this is not the case
when using the gcc libraries (mntlib20) with their emulation of ioctl,
so maybe the problem lies there.

Having found this, a workaround is simple. Just set XTABS before
using curses routines. Knowing that curses on the Atari uses file
descriptor 0 for checking tty-modes, we get something like:

```
#include <ioctl.h>
#include <curses.h>

main() {
#ifdef atarist
struct sgttyb tty;
gtty(0, &tty);
tty.sg_flags |= XTABS;
stty(0, &tty);
#endif
initscr();
mvaddstr(0,0,"this is text");
refresh();
mvaddstr(0,0,"this is junk");
refresh();
getch();
endwin();
}

Message-ID: <1992Jul5.194528.12343@ryn.mro4.dec.com>
Source record: 220073

Well, I spent most of the 4th playing Atomic Robokid on my friend's ST. I was never able to defeat that creature that you're trapped in the golden brick room with...

ANYWAY, after SERVERAL hours, I finally found its weakness and defeated it. (I won't spoil it, in case anyone is trying to figure it out themselves).

I was wondering if anyone out there knows of any "cheats", "backdoors", etc. for this game. It seems to allow you 9 lives total, 3 lives each game, and the ability to continue the game (only) twice.

ANYWAY, if anyone has any good info, please post it!

AND, if you are desperately seeking the "secret of the creature with the long swinging deadly arm", EMAIL me, and I'll fill you in!

Thanks,

John

Thanks for all those that responded, I ended up getting DIGICOMP.LZH and its quite nice. I did this because I wanted to move all my .mod files from the PC to the ST system to allow my ST to show off a little. Thanks again people.

Jeff

166. Laser printer compatibility with Ghostscript problems

Newsgroup: comp.sys.atari.st
Date: 1992-07-05 23:41:20 UTC
From: hofmann@cs.uiuc.edu
Message-ID: <1992Jul5.234120.29670@sunb10.cs.uiuc.edu>
Source record: 220121

I recently purchased an HP laserjet II+ with 512kb memory. It prints dvi files with no problem (1 and 2 pages) but it prints nothing with ghostscript (mega ST4, TOS 1.4). My question is, does ghostscript work with laserjets, and how much laserjet memory does it require? On a related note, what kind of printer drivers are available for the ST-HP combination?

Any help getting it working will be greatly appreciated.

Now, wait a moment. I've been using LHA201G for quite a long time now, and
it preserves the time/date in archives just fine on my Mega 2ST (TOS 1.02).
Perhaps your clock batteries are dead? |-)

I archive my work-in-progress daily, and I've had to restore and re-Make
from them several times. For what it's worth, I'd have to say LHA is the best
archiver to use, especially on ftp sites. Even the "10-year-old game players"
can get LHA to extract an archive to the correct directories without a shell.
If you work from the desktop (or NeoDesk, as I do), ZOO is nearly useless.

168. Downloading from UNIX system.. how?

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 00:10:42 UTC
From: lewis@trantor.trl.OZ.AU
Message-ID: <1992Jul6.001042.4365@trl.oz.au>
Source record: 220123

Hi all,

I have a 1040STE with 2MByte and HD. I have a very low success rate in unpacking archives or getting binaries to run when I download from a UNIX system (with Internet access). The two methods I have tried to date have been:

1) Use MTOOLS to copy binaries to MSDOS floppy and subsequently to the Atari. More than half of these attempts fail with problems with archive headers, bombs or TOS error 35. The archives I can unpack on the UNIX machine but I still have trouble with the binaries.

2) Using KERMIT to download to the Atari. This is generally more successful but is sssslllloooowww!

I find this most frustrating. Can anyone suggest a better way?

I must thank Darek for the respectful and thoughtful posting. If you'd done more like this (perhaps not discussing "free source" for the more commercial offerings!), the ST world might be a little happier with you, and probably vice versa as well.

A little kindness DOES go a long ways.

173. Mine Sweeper??

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 03:34:22 UTC
From: pinelr@aix.rpi.edu
Message-ID: <+2-xa6f@rpi.edu>
Source record: 220127

Hi there! A little while ago my girlfriend saw a game called "Mine Sweeper" on a clone with a window manager. While she has her own clone, it serves as an expensive paperweight, and I don't want her to spend $$$ to get a window manager (and mouse, and mouse card...) that I know she'll never use just so she can play Mine Sweeper (apparantly it comes with Windows). A friend told me he has a PD version of it for his Amiga. My question is: is there a PD version of it for the ST? I've never really seen the game myself but I would like to get it for her since she uses my computer to play Defender of the Crown more than she's used her computer ever! If there is a commercial version of it that's ok too... I'd just like to find it. Thanks.

177. LZH Date Problem

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 06:42:32 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1992Jul6.064232.19025@peponi.wcc.govt.nz>
Source record: 220135

I think I have found the reason for the Date problem that Bill
is on about with LZH201..

It has nothing to do with LZH201 at all, there is a problem with moving files
with TOS less than 1.4, if you move/copy a file with TOS less than 1.4,
the date will get changed to the current date, this is a TOS fault not a
LZH201 Fault...

LZH201 generates temporary files for extraction, from memory, but then they can
get moved to the destination drive, hence the problem, you can from memory set
the drive that is used for these temporary files...???

As ZOO 2.1 does not have extraction redirection, it dose not have this problem..

Note: This is my theory to this problem and could be incorrect...!!

Iam just one of those stupid 10 year old games players...:-) that they
let on here....!!!

So Bill its time to get TOS 1.4, gee I could not live with out it..

Roger... sheppard_r@kosmos.wcc.govt.nz

I'm interested in seeing H&S support big libraries. I mean really BIG!
I modified 1.2's linker to support bigger libraries and 2.0 eats them up just
fine.

>That's one reason I'm using 2.0 instead of H&S

And that's one of my reasons.

180. New version of Prolog-68 on a.a.u.e

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 08:41:01 UTC
From: jensk@hpbbrd.bbn.hp.com
Message-ID: <86010030@hpbbrd.bbn.hp.com>
Source record: 220071

There's a new version of Prolog-68 available on atari.archive.umich.edu,
currently in atari/new.
It is not yet TT-proof, and several features remain unimplemented. The main
reasons for posting this version are: (1) it fixes several nasty bugs in the
compiler and (2) I will adapt the system to the draft ISO Prolog standard, so
the next version may take a long time to emerge (I work full-time nowadays).

Thanks to Marinos Yannikos for uploading this (I don't have access to the
public Internet).

Very well put, I do know about running ZOO in untoped windows, but gee what a pain, I thought this it was 1992..

Zooboy was the shell that I have used for some time, the other arcgshell41 from memory has to many bugs for me, no test archive option, plus not much help in driving it, it needs better documentation...

A lot of the problems that I had with ZOO is when I could no longer use the Shell (Zooboy) and I had run it from 2 disk drives and the desk top..

To me LZH201 was a dream to use...

There is I think a PD date fix program to correct the copy of dates with TOS < 1.4, ICD does have one with there software, but I have read it can be a bit buggy, but it has been updated, are there any other date copy fixers, Gribnif comes to mind..

>unpacking a:\file.lzh is probably too much to ask...

Do you know how many Atari users can figure out how to "x
a:\archive.ext b:\destination" using ZOO?? Not many. I don't think
it's really even covered in the documentation. In GEM (which is what
most atari users use right?) you have to open or "top" the drive b
window then either select zoo from there (if you had the room to put
it on drive b) or, if you need all the space on drive b, use the
"right button select in non active window" method. I'd call this too
difficult for most Atari users. The usage of ZOO obviously comes from
a UNIX environment, which is not what most Atari users are used to.
If there were a few things added to the Atari version of ZOO, like
command line redirection of files, or a good ZOO shell (is there a
good one?) I suppose more atari users would go for it. But somehow I
doubt it. There's not a "good" enough reason.
The only reason lharc beat out arc is better compression. The two
main points I see touting the value of zoo over lharc is file info
handling (folders, timestamps, etc), and portability. Neither reason
is likely to be very important to most users. Especially if lha can
be compiled anywhere, and the new version of Questor's lharc fixes the
other reason.
Don't get me wrong. I rather like ZOO 2.1 now. (it grew on me :)
I just don't see the populous taking to it.

On a similar side note, Bill said something about how promoting ZOO
and MiNT and moving away from GEM was helping move the ST into the
mainstream. Mainstream UNIX users maybe. But not the mainstream
public. I can't see any form of UNIX or X becoming *that* much of a
mainstay for Atari's. Too cumbersome no mater how cool it is.

Something more along the lines of Multi-TOS seems more mainstream.
People seem to like easy WIMPY over CLI etc.

184. Crackart English Docs

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 09:52:29 UTC
From: shore_c@kosmos.wcc.govt.nz
Message-ID: <1992Jul6.095229.21035@peponi.wcc.govt.nz>
Source record: 220140

Hello,
well it seems to be the case that the english docs aren't on a.a,
so i'll upload them there as soon as I can work out how to do it!!!
Sending them from here (wcc) to a.a isn't a prob, it's getting them
from ChCh (where I live) to wcc (a hell of a long way away!). It's
a VAX, and i'm using Uniterm on my atari! - yup, an atari owner reading
the atari newsgroup at home using UUCP, and online internet with his
atari!! - gee, I bet there's not many that can lay claim to that!

Yeah, well anyway, i've sent a message to Roger asking him to explain how
to get the VAX's ZModem going (I can get it to send ok, it's receiving
that I don't know), so as soon as I can, i'll upload the docs.

Craig.

185. New GNU and G++ libs: Any experience ?

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 09:55:30 UTC
From: ASI503@DJUKFA11.BITNET
Message-ID: <92188.105530ASI503@DJUKFA11.BITNET>
Source record: 220137

I've compiled the new gnu.olb PL81 and g++.olb PL12 and it works fine.
Only exception: the iostream.cc of Patchlevel 12 results in an error message.
So I've built the library with iostream.cc PL11, which compiles without an
error. The resulting g++.olb stands all the tests as far as I checked it.

Is there anyone who managed to built the complete g++.olb PL12 ? What are
your experiences with the new libs?

Erik Sodtke <asi503@djukfa11.bitnet>

186. Help - 2 questions - please read

From: rlw@ukc.ac.uk
Message-ID: <1285@eagle.ukc.ac.uk>
Source record: 220141

I have a couple of questions which are of quite high importance given the amount of time I have invested in solving the problem.

I have been after an American Football simulator on the ST for some time now, I had heard about one called TV Sports (US) football which sounded ideal, but I have since found that noone can get it for me (a couple of mail order places said they could deliver and didn't, and one -Lazer Software- even cashed my cheque and then said they could not get it (I did get a refund however after a bit of hassle).

I think this may be illegal, but does anyone (preferably in the UK) have a second hand copy they wish to sell, reasonable offers are considered (the mail order places have it advertised for 8 squids plus P+P - but then they can't get it can they).

Also on the same problem - does anyone know when John Madden Football will be released on the ST (or even if it will).

Second problem. I have been using the excellent KAOSdesk. There are 2 questions about this.

Is there a complete english version, mine is about 75%english and 25%german. I would like to get hold of 100%english (alert boxes are still german at the mo).

Second - there is no mention of the program being shareware, but on the other hand it does not say it is free either, what is the case with the program?

Cheers All

Dick

> and how much laserjet memory does it require? On a related note, what kind
> of printer drivers are available for the ST-HP combination?

I also had a HP-Laserwriter for my TT, and I also got only 512KB Ram.
There is a big problem: YOU NEED ALMOST 1.5 MB RAM for printing usual
ST-Graphix! Why? Well, If you do not take the internal fonts of your
printer, you will have to send graphix to the printer. Now, guess, how
many KB will that be, sending 300*300 dpi on a legal-paper?

But why can you print DVI-Files? Maybe there is much space and less
graphix, so the Laserjet can pack the datas.

Ghostscript can print to a HP, but you will have to put more RAM in
your printer... :)

Greetings, Roland.

As far as I know, there is no. But most of those alerts are a german translation for TOS errors.
But I guess you can figure out what the boxes are about? Perhaps, when I'm less busy, I could translate them and post them here... (right ?)

|>
|> Second - there is no mention of the program being shareware, but on the other

There is no mention about share- or freeware or even public domain, because it is *NONE* of all above! It is sold, I guess Ippen & Prentzsch (or so). I don't know yet, because I forgot to look before coming in here.

Yes, the object table in 1.4 has been expanded to link twice as many
object modules and ignore (skip over) up to 300 library modules. You can't
reliably use GEMFAST 1.8 without the expanded linker -- the new GEM
library has many more pieces.

190. Atari & MIDI

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 13:47:01 UTC
From: aa596@cleveland.Freenet.Edu
Message-ID: <1992Jul6.134701.13995@usenet.ins.cwru.edu>
Source record: 220146

To all Atari ST/TT MIDI users:

I am compiling a list of common configurations/software/hardware and what
is actually being used by Atari ST/TT owners for MIDI. This list is for
an Atari MIDI forum on the Cleveland Freenet. So if you have a few minutes,
could you answer the following questions:

1. Type of machine you are using (Hardware model/memory/harddrives etc)

2. Software you use/have and its relative merits:

3. Utilities for MIDI you use (Comercial/PD):

4. Reference materials:

5. General Comments about Atari for MIDI:

Thanks in advance for all replies. Reply via e-mail if possible, but
this is not manditory. I will post the compilation here when it is
finished. Thanks again.

PCH

>gather (from the file itself, since I couldn't make sense out of the
>documentation) the program supports 38400 baud, 72600, and 15600 baud.
>Is this true and will it work?

Well, I can't say if it will work for your case or not, but I have used the accessory (HSPD_232.ACC) to do null-modeming between my MegaSTe and 286 with no problems at 38400 baud. At least in this case, yes the accessory does work as advertised (it's real cool seeing the files fly at 38400 baud). In case anyone wonders, yes, I know I can put PC disks in my ST, etc. The reason I null-modem is because my PC has a 720k drive, and I'm using 1.44M disks on my ST (now there's a switch, eh? :-)

I do have one "problem" however with this accessory, or rather with its options. The accessory does give the choice of 38400 and two higher speeds, but the speeds that it does have (above 38400) do not match any of the high speeds that my PC term programs handle (namely Procomm and Telix). If there was a way to set a custom baud rate, then that would be even more useful (BTW the PC term supports 57600 and 115200 baud, while the ST supports 38400, 72600 (I think) and 156000 (I think))...

Are you FTPing the files, either from a site to your unix system,
or from your unix system to the PC? Make sure that the transfer is
set as BINARY and not ASCII (i.e. type "binary" at the FTP prompt).
FTPing in ASCII will convert carriage-return/linefeeds in various
ways, and I can see that posing a definite problem if that's what's
happening...

I'm not real familiar with MTOOLS, however. Can you give a short
explanation of what it does?

>2) Using KERMIT to download to the Atari. This is generally more
> successful but is sssslllloooowww!

You might want to get the source code for Zmodem (SZ and RZ) and
compile it on your unix system. That way you can use zmodem to
transfer the files, which is LIGHT YEARS faster than Kermit.
Someone on this newsfeed could probably point out a source for the
zmodem sources...

Speaking of ASV (i.e. Unix) for the TT: I was told by a local dealer that Atari's Unix SysVr4 should be available to the end user (not developer) in June. Does anyone know if it will be available soon?

From: ugafence@ubvmsb.cc.buffalo.edu
Message-ID: <Bqyzux.68r@acsu.buffalo.edu>
Source record: 220145

I'm just curious...

I've seen reference to different laser printer number, 804 & 806 I believe. What's the difference, if any? Also, if I were to buy one used, what is a good/fair price? And (finally) what should I know about the barrel, ink, and any other changeable parts...

Maybe that shouldn't say "I'm just curious" up top but "I'm just a little bit more than curious", instead...

Yes. It is called Demolition Man, although I don't know whether it is freeware or shareware. It is available on GEnie (with the name appropriately scrunched to 8 characters, such as "demolitn" or something :-) I have also read about another version, but I forget the name of it.

Good luck.

>People seem to like easy WIMPY over CLI etc.

While I will agree that adding useful features to software is a good idea, I definitely disagree that software should be blamed in cases where people don't know how to use their computers. I also disagree in principle that software should do things within itself that can be easily accomplished in another way. (Although sometimes this principle must be set aside in favor of being nice & considerate to software users.)

The whole point of "right button select in non active window" is to allow programs -- ANY programs, not just ZOO -- to be run in a current working directory other than the directory containing the program itself. Thus extraction redirection is not a problem with ZOO, but a problem with people who don't understand the use of GEM. Whether or not ZOO ever incorporates command-line redirection of the target directory, there IS a way to handle it within GEM, using a normal, documented feature of the operating environment.

(And despite Roger Sheppard's statement "gee what a pain, I thought this it was 1992", I think it's better to let your OS take care of things like this if it can. Why waste code putting in a feature that forces people to know about directory structures and makes them type full path names in a TTP parameter box that might be too small to fit everything in, when the right button method will do the same thing with two mouse clicks and no typing?)

Perhaps Bill Shroka or somebody further upstream will add this feature, or at least document the right button method explicitly in a README.ST file, for those who haven't read about it in their ST manual. But in the meantime, I'd say it seems clear that redirection is not an issue between ZOO and LZH; therefore (for me at least), I choose on the basis of other factors. (And I happen to have chosen ZOO.)

BTW, at the end of your message, you stated that people seem to prefer "easy WIMPY to CLI", but what you're advocating is adding a CLI feature to ZOO to make up for a WIMP feature that you claim is too difficult for people to understand and use. Seems inconsistent. We'll make a total ZOO convert of you yet. :~) :~)

>well.

theres at least another problem with these `negative' timezones we
europeans have (1 or 2 hours east of GMT, like TZ=CET-1). it adds
files with `+64' instead of `-2', and if you unpack that they are
sent 3 days into the future... and if you run it with TZ=GMT instead
you lose 2 hours.

anyway, solution is to recompile with GETTZ #undef'd, then it doesn't
care about timezones. (neither does lharc... :-)

[...]

When unarcing on the Unix side, you need to specify the 'i' flag or your
binaries will be corrupted. The reason is that arc (at least the version
I have) has the default behavior of newline/return translation (which makes
your text files look right). The 'i' option suppresses that translation.

As a test, after you have unarc'ed an archive containing both text files
and binaries, use 'vi' to look at a text file. You should see a '^M'
at the end of each line. This is your guarantee that your binaries are ok.
You can also compare the size of the file after extraction to the file size
inside the archive, i.e.:

```
host% arc l fatspeed.arc
Name Length Date
============ ======== =========
FATSPEED.PRG 7408 19 May 88
README 3987 3 Jun 88
==== ========
Total 2 11395
host% arc xi fatspeed.arc
...
host% ls -l FATSPEED.PRG
-rw-r--r-- 1 wmagro 7408 May 19 1988 FATSPEED.PRG
```

The sizes of the two files match. Now you can transfer with mtools, and all
will be well.

[...]

I think I've seen 'Mine Sweeper.' Tell me if I am correct: you try to find all the 'mines' in a rectangular grid. Each time you find a spot with no mine, the computer gives you a number, indicating how many mines are on surrounding grid locations. Using logic and luck you try to 'mark' the locations of all the mines.

If this is the game, then there is indeed an Atari version, and a very nice one indeed. You can get it on atari.archive, and I think the name is blaster.lzh. Because of the dreaded LZH packing, I couldn't check the contents of the archive, so I am not sure.

If this is incorrect, I can find the name of the archive after a trip to my atari tonight.

ARGHH! Can someone add the 'extract redirection' feature to zoo to quiet these desktop-only types. Then they too can move over to zoo, and the world will be a better place. *:^)

206. new uploads to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 17:35:39 UTC
From: rosenkra@convex.com
Message-ID: <1992Jul06.173539.4076@convex.com>
Source record: 220055

uploaded to atari.archive.umich.edu:

strsed.zoo string function which works with reg exps (like sed or ed)
includes GNU grep 1.6 regex package.
tpipe.zoo like tee, only pipes to commands not files (MiNT only).
which5.zoo nice which(1) that has -a option (all) to find all things in
path, not just first. intended as replacement for tcsh's
builtin which. can also find aliases.

all these were originally posted to comp.sources.misc some time ago. i find
them useful. all were compiled with gcc 1.40 MiNT libs PL 19. source, .ttp
(or .o for strsed) manpages, and makefiles included.

enjoy...

```
Hello,
I was interested in your benchmark so I ran it
on my SGI 4D/30 (30 MHz R3000). This is what I got:

using bundled cc
3000 primes took 26.379999 seconds (user CPU time).
using bundled cc -O4
3000 primes took 26.190001 seconds (user CPU time).
gcc 2.2.2 -O2
3000 primes took 27.379999 seconds (user CPU time).

On an SGI 4D/35 (36 MHz R3000)
cc -O
3000 primes took 21.860000 seconds (user CPU time).
cc -O4
3000 primes took 21.840000 seconds (user CPU time).
gcc -O
3000 primes took 24.520000 seconds (user CPU time).
gcc 2.2.2 -O2
3000 primes took 21.860001 seconds (user CPU time).

On an Indigo (33 MHz R3000)
gcc -O2
3000 primes took 23.990000 seconds (user CPU time).
cc -O4
3000 primes took 24.000000 seconds (user CPU time).

On an SGI Power Iris 360 (4-33MHz R3000s 2-40MHz R3000s)
bundled cc
3000 primes took 19.629999 seconds (user CPU time).
cc -O4
3000 primes took 21.000000 seconds (user CPU time).
gcc 2.2.2 -O2
3000 primes took 23.740000 seconds (user CPU time).

We may be able to try on a Crimson later today....

> Now, wait a moment. I've been using LHA201G for quite a long time now, and
>it preserves the time/date in archives just fine on my Mega 2ST (TOS 1.02).
>Perhaps your clock batteries are dead? |-)

batteries are fine. zoo, lha (the unix one), arc, and gnu tar all "do the right thing". here is what i did:

download a .lzh file to st.
lha201i v file.lzh
(shows dates/times < today)
lha201i x file.lzh
(all files have today's date and time of extraction)

this was done on mega4 (TOS 1.2) under MiNT 0.94. i will double check this, but i also recall this behavior without mint. these are US ROMs, BTW. roger sheppard also indicated that this was a bug in LHarc because there was a change in GEMDOS Fdatime() at TOS 1.4. i don't have my TOS 1.4 release notes handy to confirm this. i also tried this with LHarc 2.01e with similar results. i have not tried with 2.01l. i also use the IDC hard disk driver at rev 5.5.0 (if that matters). i also have GDOS 1.1 installed. the harddisk i have has an ICD Adscsi host adapter which is supposed to have a clock. the mega also has a clock. from what i can tell everything should be sync'ed since all the other archivers work fine as does things like "cp +t file..." from gulam and "cp -p file..." with the gnu file utilities. it could very well be a problem with my config, but then again why does everything else that deals with file dates work correctly?

if you can preserve the timestamp with a command line switch, i'd be interested to hear about it. i could not find anything in the docs (most of which are either in japanese or german that i have) that seemed relevant. i think this should be the default behavior anyway (ie preserve the dates without having to ask for it). if you think i have a funky config, this would also be nice to know. i set the system clock with the control panel and with an ICD utility. i also have a touch(1) utility that works fine (GNU) and my own version that calls Fdatime() directly.

actually this no longer matters since i have the unix lha 1.00 running on my st and plan to use it when i have to deal with .lzh, at least until lh6 happens :-(. so far it looks like it is going to work tho it is still slow on creating archives. since it is as fast as LHarc on extraction, i presume i will continue the (time consuming) practice of .lzh -> .zoo conversion...

thanx

>
>LZH201 generates temporary files for extraction, from memory, but then they
>can get moved to the destination drive, hence the problem, you can from
>memory set the drive that is used for these temporary files...???

ok, this explains it. i also think this can be fixed by simply doing an Fdatime() on the moved file. we can argue, but i think this is an oversight at least in LHarc. it should be a trivial fix (that would make me happy :-). actually, i was not using the redirection option of LHarc, so why does it need to make copies? if it does, this seems like a wasteful step (meaning LHarc should thus run faster).

do u know if LHarc creates a temporary ramdisk or holds the files in memory? how does this "redirection" work? where are the temp files?

>So Bill its time to get TOS 1.4, gee I could not live with out it..

i have TOS 1.4, rog. i just don't want to upgrade all 3 ST systems i own. hey, in the same vein, get a hard disk. you won't need "redirection" then.

are we pals again? i note a distinct aire of civility in our articles these days... :-)

ciao

From the Holy Book of <BqzA4q.But@news.cso.uiuc.edu>
as spake by wmagro@uiuc.edu (William Magro) :
>I think I've seen 'Mine Sweeper.' Tell me if I am correct: you try to find
>all the 'mines' in a rectangular grid. Each time you find a spot with no mine,
>the computer gives you a number, indicating how many mines are on surrounding
>grid locations. Using logic and luck you try to 'mark' the locations of all
>the mines.

>If this is the game, then there is indeed an Atari version, and a very nice
>one indeed. You can get it on atari.archive, and I think the name is
>blaster.lzh.

I have the game you describe. It's called Demolition Man, and is on
atari.archive at atari/games/dmltnman.arc. Hopefully this is what was
wanted.

[Blaster is a completely different game, sort of a Defender clone.]

211. Re: TI TMS320xx Assembler

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 19:45:59 UTC
From: rossin@hpfcso.FC.HP.COM
Message-ID: <7340103@hpfcso.FC.HP.COM>
Source record: 220070

I have one that I wrote for the TMS320C30 and TMS320C31 processors. It is somewhat limited but it does enough to get me by. If you would like the source or executables drop me a line:

Ted Rossin
rossin hpfctgr.fc.hp.com
303-229-4179

By the way, the code is written in C and was compiled using Mark Williams C version 1.1 on the Atari ST. The code does compile and run on MACs and on HP 9000 series 300, 400 and 700 workstations. The series 700 (Snakes) machines are really fast.

212. Mono Monitor Flakiness

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 19:54:29 UTC
From: klassa@aurs01.UUCP
Message-ID: <60886@aurs01.UUCP>
Source record: 220065

My mono monitor (bought used about six months ago... looks like it's NOT one of the original, "nice" models due to the placement of the controls) has started to weird out on me. While running Uniterm this morning, it suddenly jumped (i.e. without provocation) into a mode where the height of each of the 24 text lines decreased seemingly linearly from top to bottom. The top lines were quite large while those at the bottom were about 1/3 to 1/2 the size of those at the top (those in between were somewhere in between, in height). Pressing ALT-F2 (I believe) to put Uniterm into 24-row mode helped once, but failed to help any at all after the monitor entered the strange new mode for the second and subsequent times.

Is this the same kind of death that others have reported seeing in their mono monitors? Is the end near? Any info would be greatly appreciated!

Thanks in advance,
John

The Atari archive version off zoo worked very fine for me so far, and it
does know about the unixmode, getting the long filenames right. You need
it, if you are going to compile unix software, since the names are longer
than 8.3 . I don't thinkany lzh program does that.

On the contrary, I had trouble with the initial lzh programs, and don't like
using them anymore.

Message-ID: <1992Jul6.202916.24813@magnus.acs.ohio-state.edu>
Source record: 220063

Hullo.

I just finished download tcsh from atari.archive last night, and I was quite dismayed to find out that the arrow keys only work if you use MiNT's stty, or have another program to rebind keys to something approximating a vt100. I use tcsh on most of my other systems, and I would have (still would) like to use it on my Atari too.

So I'm asking. Does anyone know of a program I can get via ftp (or other similar method) that will allow me to remind my keys properly for this?

Thanks in advance for any/all info.

216. How can I extract Font data from TOS?

Newsgroup: comp.sys.atari.st
Date: 1992-07-06 20:49:04 UTC
From: Terry_C._Wells.ES_AE@XEROX.COM
Message-ID: <".6-Jul-92.13:49:04.PDT".*.Terry_C._Wells.ES_AE@Xerox.com>
Source record: 220064

I'm building a project using my ST and I need to read the Font data from ROM (or RAM).

The documentation I have (Atari ST Internals, TackleBox ST) isn't very clear about Fonts and gives no useful clues as to how to read it. TackleBox ST did have an address where the font data was supposed to be, but it appears that the address they give is only valid for TOS 1.0.

What I want to do is get the Font data (hopefully as an 8x8 grid, but I can deal with something more complicated if need be) and send it to a printer-like device attached to the parallel port.

If I need to use GDOS to load Fonts into RAM, that's ok, as long as the characters are 8 bits tall.

I know the data is in there, I just need to find out where. Any help at all will be greatly appreciated. Thanks.

The reason it works for you is probably that you have a Mega STe,
which can handle the 38400 serial speed. I tried it with my 8 MHz STe
with a Courier HST DS, and there were characters lost and garbage in
everything the modem sent. Probably even the MegaSTe couldn't handle
speeds like 57600 even if the Accessory supported it.

>will be a better place. *:^)

The problem is in using atari's ttp feature itself. Perhaps a better
solution than hacking ZOO (which is my preferred archival program) is
to write a simple "ttp wrapper" function. What I envision is something
similar to the "gtp" program posted here several months ago; what the
program should do when installed properly is this:

1) User double-clicks on a foo.ttp file.
2) ttp.prg is launched with the desired foo.ttp as an argument.
3) It displays a dialog like that of the desktop's ttp handler.
4) The box has a field for arguments _AND_ a field for the
"current directory" that foo.ttp should be run under.
5) Then ttp.prg changes the current directory, launches foo.ttp
with the right arguments, restores the directory after foo.ttp
exits.

This way, the "current directory" problem with many cli-type programs
can be solved easily for people who prefer ttp launching of their
programs.

I don't have the time to write such a utility, but perhaps the person who
wrote the "gtp" program might be persuaded to knock this one off in a
couple of hours.

My latest attempt was with CS-TEX. I ftp`d the zoo archive to my UNIX
system in binary mode (I can unpack it on my UNIX system).

> FTPing in ASCII will convert carriage-return/linefeeds in various

MTOOLS is a package for UNIX systems that allows them to read/write
MSDOS floppies. People I work with have no trouble using this method to
copy binaries/archives to Amigas. I thought Atari's could read/write
MSDOS floppies also???

>

Problem is: I wish to use the disk drive if I can since at 1200 Bd, the
transfer of the CS-TEX package will take hours (even with zmodem),
assuming the connection stays up (which it regularly doesn't).

There are four things that I think would be nice for the .ttp launcher in
the desktop: real wildcard expansion, alterable current directory, filename
completion, and the option to load the program before entering the parameters
and running the .ttp. Of course, by this time, you have most of a shell...

Vax-Zmodem is pretty basic.

downloading:
(Z-Modem Send)

parameters: type -b
filenames: type name of file/s to download. (if you want to download
more than one file, just put a space between each filename)

uploading:

(Z-Modem Receive)

just type -b for the parameters, and commence uploading!

225. AHDI 5.0 and SH204

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 02:11:02 UTC
From: hasse@solace.hsh.se
Message-ID: <1992Jul7.021102.8400@solace.hsh.se>
Source record: 220082

Is there anyone who knows why the latest version of AHDI (5.0) and HDX
doesn't recognize a SH204 when you want to low level format it??

If you use an older version it works okay, but not 5.0. When you boot
with AHDI 5.0 it types out the type of harddisk you have (ie. ST225,SY555)
but with the SH204 it only types out some garbage. Could have something
to do with that the SCSI->ST506 adapter can't handle the 'mode sense' that
the new AHDI uses?

Anyway, the problem isn't serious so I can manage as it is, but I would like
to know why.

226. Has anyone successfully ftp'd GCC 2.1 from atari.archive....

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 02:43:00 UTC
From: dholland@cc.weber.edu
Message-ID: <6JUL199219431520@cc.weber.edu>
Source record: 220080

I recently ftp'd gcc 2.1 from atari.archive.umic.edu in binary mode.

I tried both the large file gcc21b02.zoo, and the 4 smaller ones (zaa-zad) in the subdirectory (catting them together) but was unable to un-zoo them due to an invalid directory entry error.

Is the new version worth installing compared to G++ 1.39.1 (which I might add is wonderful).

Any response would be greatly appreciated,

Sincerely,

David Holland

228. HELP with ZMODEM

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 03:33:56 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <6JUL92.23335617@cc4.crl.aecl.ca>
Source record: 220085

For several months now, I have moved files back and forth between a VAX and my TT using STalker3 and an SL/1 digital modem. Transfers take place at 19,200 baud with no problems at all (use SERIALFX.PRG and AUXINIT.PRG, the latter set to a 30K buffer).

A few days ago I received a Supra V.32bis modem and tried file transfers at 9600 baud. The xfers stop and restart after the first 5120 bytes and then stop/restart after every 6144 bytes thereafter. Obviously, I have to set some parameter on the VMS or the STalker ZMODEMs. Problem is, I have no idea WHAT to set.

For info, the VMS version of ZMODEM tells me the following:

```
Send file(s) with ZMODEM/YMODEM/XMODEM Protocol
(Y) = Option applies to YMODEM only
(Z) = Option applies to ZMODEM only
Usage: sz [-2+abdefkLlNnquvwYy] [-] file ...
sz [-2Ceqv] -c COMMAND
\ Force next option letter to upper case
sb [-2adfkquv] [-] file ...
sx [-2akquv] [-] file
+ Append to existing destination file (Z)
a (ASCII) change NL to CR/LF
b Binary file transfer override
c send COMMAND (Z)
e Escape all control characters (Z)
f send Full pathname (Y/Z)
i send COMMAND, ack Immediately (Z)
k Send 1024 byte packets (Y)
L N Limit subpacket length to N bytes (Z)
l N Limit frame length to N bytes (l>=L) (Z)
n send file only if source newer (Z)
N send file only if source newer or longer (Z)
o Use 16 bit CRC instead of 32 bit CRC (Z)
p Protect existing destination file (Z)
r Resume/Recover interrupted file transfer (Z)
q Quiet (no progress reports)
v Verbose - provide debugging information
w N restrict Window to N bytes (Z)
Y Yes, overwrite existing file, skip if not present at rx (Z)
y Yes, overwrite existing file (Z)
Z Activate ZMODEM compression(Z)
sz 3.07 2-02-90 for VMS by Chuck Forsberg, Omen Technology INC
```

"The High Reliability Software"

The VMS version of ZMODEM uses all that UNIX type crap for parameters (antithesis of user friendly). Could someone PULEEZE help me out.

Well, I just downloaded Let `Em Fly v1.17 from atari.archive. It's a dialog replacer much like FormDoIt. All the docs are in German, but it's fairly easy to understand.

And boy it is neat! You can drag dialogs and alerts around the screen, you can have the dialog hot keys in color instead of underlined, alert box icons can be in color, there is a history to allow you to recall the last several dialog test lines you've edited, control-arrow keys move you left and right by words in an editable field, and of course it has almost all of the features that FormDoIt has!

I was all set to install it as my new dialog replacement when I discovered the dreaded catch. It doesn't work with UIS III's extension menu. Arrrrrrrrrgh! (And it also leaves droppings on the screen occasionally, but I could learn to live with that).

So, does anyone know if there is a newer version of this program available that might have these bugs fixed? If so, where can I get it? Or maybe the folks at Gribnif would be kind enough to add features like these to FormDoIt (I almost feel traitorous to be switching dialog customizers).

If you want to check out Let `Em Fly for yourself, it's in /atari/utilities/lmf117.zip.

Please, let there be a perfect solution to my dilemma!

Thanks for listening to my slightly deranged ravings,
Joe

It's a bug with .ZOO.

The file's been ZOO'd in such a way that the directories look like:

C:/DIRECTORY/

instead of

C:\DIRECTORY\

like they should. (The direction of the slash reverses) - ZOO 2.1
doesn't like that - I was told how to fix that a couple of days ago,
but I've since forgotten, (I usually whip out Disk-Doctor and
re-reverse the slashes). How's this by-passed guys?

> maintained gcc (for example) under TOS?? What problems will I encounter (besides
> this file name problem)??

as you can imagine i do maintain several such source trees
under TOS (thank god for removable cartdridge syquests!), i use
UNIXMODE with a set of unixmode aware utils (ls, rm, mv ...) (while
eric is off doing penance!), and have'nt really encountered any
teething problems. anyways, even if you truncate the 8.3 names i think
there are only a few clashes, so i suspect its quite feasable.
attached below is a script to help you discover what clashes if any
you would find.

of course using mfs with MiNT is a nice solution.

extract and run with perl (available on A.A in ...languages/perl*.zoo)
(probably a good idea to set UNIXMODE whilst running this script):

```
-------------------------cut-------------------------------------------
#
# check 8+3 filename clashes recursively
# usage: perl 83.pl [dirs] (. default)
#
# ++jrb bammi@cadence.com
#

sub checkdir {
local($dir) = @_;
local(*DIR);
local(@dirstack);
local(%longnames);
local($clashes) = 0;

print "Examining $dir:\n";
opendir(DIR, $dir) || die "could not process $dir";
local(@filelist) = readdir(DIR);
closedir(DIR);

One thing that I don't like with xyz.ttp is that it does not batch uploads
very well, all the file names have to be in a Temp file, it should use the arcv
method for this...

I prefer to use the GEMRZSZ or GEMRXSX programs...

234. Position Available -- new Portfolio SIGOp for CFN

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 04:56:18 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992Jul7.045618.10653@usenet.ins.cwru.edu>
Source record: 220087

The position of Portfolio SIGOp for the Cleveland Free-Net is
available.

You should have a knowledge of the Portfolio, the programs available for it,
and a little or a lot about programming it.

Also, you must have enthusiasm, perserverance, and enough time to shape
up the Portfolo Support Area into a great informaton source for users.

Some of the benefits are that since we are planning the release of
a "new" Atari SIG in less than two weeks, you will be able to create
the Portfolio Support Area that you desire.

Also, unlimited amount of time on the Cleveland Free-Net.

If you think you think the Portfolio is a great machine and would love
to help other users with their Portfolio, why not think about it?

A present Free-Net ID would also help.

Send all interests to: aa399@cleveland.Freenet.Edu

Ok, I've managed to upload the docs!! all I needed to get zmodem going
was to type -b for binary (so simple, but so difficult!), so thanks
to Roger for that little tip! :-)

The file is ckartdoc.zoo in the directory /atari/new on
atari.archive.umich.edu

It's a translation of the german docs done by Kervyn D. Mach from
the Miami Valley Atari Computer Enthusiasts.

Someone mentioned about an incomplete translation to me in mail, this
appears to be complete, but I only took a quick look, i've never read
the whole thing!

BTW: the zoo file is 32758 bytes.

I'm having somewhat of a problem with a door I'm trying to write, perhaps someone can help me. My local sysop is running Fnordadel and I've written a program to run as a door for some misc. maintenance functions....my program assumes that the output is already redirected when it is activated (since I haven't a clue how to do this it a good thing fnordadel does it) so it uses ONLY stadard input and output. Yet when the door return control to fnordadel the console will not respond (this is the console of the computer the bbs is running on....) but the modem still seems to be working fine. Minor evidence exists that the output is STAYING redirected to the modem (completely, all standard I/O) from that point on. The bbs simply continues to work normally, but the keyboard entry appears to be completely unrecognized. Does this situation ring a bell with anyone? Can someone help?

Hello,

I recently had some first hand experience with Atari SVr4, while doing a quick evaluation for the French ST-Magazine. Well, it's not bad, not bad at all, but unfortunately it's quite s l o w.... Although I think some stuff was not properly configured and memory was insufficient (16 megs, out of which I was left with about 1 (!) once X was running - the disk was not very fast, either), I'd be enclined to say that ASVr4 would really shine only on a '040 (the mythical Super Falcon, maybe :-). Anyway, there are still some loose ends, but the system is quite functional, documentation is well written (even if it's a bit short), and the NSL development tools are great...

Voila, as for availability, there's already a small number of systems out in France, but there still is (to my knowledge) no official line on the subject. IMHO, I'd like to know first WHO to develop for, before going on ASVr4 development.

Greetings,

Nicolas Spengos

>
How about mentioning what some of these bugs and limitations are? I use zoo
frequently, and have yet to find a bug in it, unlike lharc which has on more
than one occasion trashed my hard disk (recoverably, thankfully). And what's
so difficult about typing zoo -a, zoo -x, etc? For the most part, the options
the inexperienced user are interested in are almost identical to lharc's
anyway. Then there's zoo's online help, at least 5 pages, including examples
of how to achieve various bits and bobs with zoo. Far superior to lharcs list
of options.

>Please look further than your nose, there are a lot of types of people that

>Simple GUI, so stop being selfish...
>
Stop being selfish?? Come on, own up, are there two people using this account?
I've noticed two distinct style of writing on it, one somewhat more mature than
the other. IS someone using their father's account?

Anyway, back to the point. There are several GUIs for zoo, and absolutely no
reason why the GUI for any archiver couldn't work with zoo. Remember, lharc
is no more GEM aware than zoo in its native form.

>They did a vot on GEnie and Z=Net on the Archiver to use and LZH201 was voted
>for, need I say any more, you are out voted by some 100,000:1

Sorry - I didn't check the curses docs. I forgot to mention that there is a separate capability that you have to set to disallow use of the `\t' character. This is an `old style' capability, i.e., new programs shouldn't use it because there is a better way to check for this case (presumably the XTABS flag that you mentioned).

So we are both right: The MiNT library should be fixed to handle XTABS, but if you are stuck with a binary program, you can also get it to work via the termcap entry.

Jens.

(Sorry, can't look up the name of that capability right now - our central file server is down, so I can't access Emacs and its info system. Arrgh.)

Source record: 220048

UK1T@DKAUNI2.BITNET writes:

>But why can you print DVI-Files? Maybe there is much space and less
>graphix, so the Laserjet can pack the datas.

If you use a reasonable dvilj program, this should be able, to use the
font download facilities of HP's laser printers. I used to dump dvi files
to a file with my dvilj and packed them to a disk. With pure graphics
output, a document of about 40 pages would have filled my HD with ~40MB of
data. But the output was only about 800K :-)

I know of two laserjet drivers for dvi files. The last version of the
program for Lindner TeX, I saw, used pure graphics. The other one, of CS,
supported font downloading!
With this technique, it is possible to print TeX output on a 512k laser
printer.

>Ghostscript can print to a HP, but you will have to put more RAM in
>your printer... :)

Doesn't GS support font downloading?

btw, I have another problem with GS and laser output. If I call:
`gs -sDEVICE=laserjet <ps-file>' I always get an error message, when
preloading fonts. The message says: `error in \Vdict'. If I use another
output device, e.g. epson or stmono, everything goes well.

Is the laser driver of ghostscript broken, or does it need more memory I
can spend for it?

Hello,
Yes I am back again!

A simple question this time.
How can I find out how much memory was put in when I had the ram upgraded?
You might think that seeing as I bought the upgrade that I should know
how much there is. That's what I thought as well.
After I read the instructions on how to put it in I decided to take it
back to the shop and let them do it.
I paid for a "1 meg" upgrade (which I thought would make 1 meg in total)
It is a simms upgrade (I think) which will let me slot in more memory if
I need it.
Anyway back to the point.
Last week I got a whole load of different acc's. One of these was called
freeram.acc (probably). When I ran this it said just under 2.5 megs free.
So did the shop install 2.5 megs instead or is it just a crap program??
(I hope it's the 2.5 megs!)

BTW Thanks for everyone who has answered my many questions!!!

:-) (I just had to put one in somewhere!)

Phil

|> with all their new ST's?
|>

(flames on)

How could you persuade Atari-Germany to do anything at all? And how do you think you can persuade them to ship a program with their machines? Glory days are gone, days when every ST was delivered with a programming language, so that you could start immediately... Mine came without any (MSTE/2 March '91)

(flames off)

(Comment: Well, I know this old BASIC was only some kinda text adventure, but looking at the above mentioned I can see the time arising when you buy your ST (or whatever its name might be in future) and have to pay another 100$ for the OS, just like in the IBM nightmare-world :-))

>ver 3.02? I know that a version 3.5 was put out, but I'm not sure if
>that is the latest. Where can the newer versions be obtained?

Yes, there is a version 3.5, but it has only one advantage over 3.02:
it is able to format high-density-disks, if your ST has the necessary
hardware-extension. But it has also new bugs, e.g. it does not work
with a 68020-board (version 3.02 does !).
It is available at a BBS in germany... but if anybody is interrested
in, i can send it to him/her via email.

249. 8031 assembler for the ST

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 14:17:47 UTC
From: idh@cns.umist.ac.uk
Message-ID: <1992Jul7.141747.11924@cns.umist.ac.uk>
Source record: 220021

In the recent FAQ (software) a 8031 cross assembler for the ST was mentioned. I have been unable
to locate such an animal in the servers that I have investigated. What is it called (the filename,
so that I can use ARCHIE to find it), and/or where is it?
Cheers,
Ian H.

250. Re: AN COOL

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 15:40:03 UTC
From: lombardo@odin.unomaha.edu
Message-ID: <lombardo.710523603@odin>
Source record: 220003

Mr. D.I. and Manikin:

With the utmost sincerity, I assure you I never meant to offend TLB in any way by making that post. I was merely defending Mr. AN Cool, because I believe he is an amazing demo coder and composer. In the middle of M Demo 3, it flashes up on the screen "This demo is lame!". Obviously, AN Cool wasn't serious about it at all!

BUT, I still believe that the demo has some value, for the music is better than anything I have heard so far from either TLB or TCB. But, I must mention that this M Demo 3 was not put out by TCB, but just by AN Cool!

If the truth be known, I enjoy TLB's demos much more than TCB's, but I really enjoy AN Cool's music more than anything. Ahhh, I doubt you even care...

In fact, when I said "You are a serious lamer, dude... " I was referring to Mr. Tim Moss, because I thought he made wrote the post in the first place... (sigh)

Well, on with my futile attempts at assembly. Long live the masters!

251. INFO: All submissions have been posted (finally)

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 15:47:40 UTC
From: koreth@twitterpater.Eng.Sun.COM
Message-ID: <l5jf4sINN1rn@appserv.Eng.Sun.COM>
Source record: 220002
Cross-posted to: comp.sources.atari.st,comp.binaries.atari.st,comp.sys.atari.st

Thanks to a nice vacation last week, the comp.binaries.atari.st and comp.sources.atari.st submission queues are now empty. Time to send in some more!

The rest of this message will sound a lot like a similar one in comp.sources.unix not long ago. You can stop reading here if you don't plan to submit things to either group.

My response time is usually nothing to write home about. Part of the reason is that I try to send things out in more or less the order they arrive (with some exceptions.) When I get a slew of three or four submissions that have problems (both source and binary included in one archive, weird archiver used to pack, whatever) they tend to sit at the head of the queue until I have time to deal with them. Perfectly clean submissions further back in the queue suffer as a result, and it takes a big chunk of free time like last week to get everything moving again.

So, in the name of keeping the trains running on time, I'm going to be a little stricter about rejecting submissions in the future. Up until now, the only reasons I rejected things were if I couldn't get them to unpack at all (usually due to data corruption) or if I tried them out and they didn't work. I'll still reject things for those reasons, of course, but I'll no longer spend time going through the zillions of different versions of LHarc one at a time to try to unpack something, trying to figure out which of the datafiles need to be included with both the source version and the binary version of something that arrived all in one chunk, or searching through the source code for a big comment in the middle that can be used as a description for the top of the article. If it's not pretty much ready to go when I get it, I'll tell you what's wrong with it and move to the next item. I'm still perfectly willing to repackage things with zoo if they come in packaged with arc (I feel the space savings, sometimes in excess of 30%, are worth it) or whatever -- but I'll limit myself to fiddling with the format of the submission in a coarse way, rather than shuffling through its contents.

There's nothing really new here; I'm not asking anything that hasn't been in the two groups' introductory articles pretty much from the start. Most submitters will be perfectly fine; in many cases, I don't have to touch incoming submissions at all, except to change the mail header to a news header. I don't expect to be able to do that all the time, or even most of the time, but I'd like to stop the practice of spending three hours trying to get a single submission into a form people can use.

Feel free to post or mail comments or replies.

-Steve

252. Gravis MouseStick - How to get it?

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 15:56:19 UTC
From: gernot@ira.uka.de
Message-ID: <13cer3INNdth@iraul1.ira.uka.de>
Source record: 220100

Hello out there. My problem is as follows:
I have bought 'Flight of the Intruder', a SpectrumHolobyte Flight Simulator.
However, I am really tired of the imprecise feeling of digital joysticks,
and the FOTI manual mentions the Gravis MouseStick, a joystick that somehow
uses the Mouse port to simulate an analog joystick.

My question goes out to the German, and/or European readers of this group.
Does anybody know the importer of Advanced Gravis products in Germany, or
some mail order business that can help me? Or even an idea of how much I can
expect to pay for one?

I'd be very thankful for any information that helps me obtain one of those.

Gernot

I had a similar problem when I first tried using zmodem (though at a lowly
2400 bps): the transfers just hung after the first 4096 bytes. My solution
was to try a `ps -ef |grep sz' and see what options other people were using
(yes, its user hostile UNIX). From this, I found that the -w 4096 option
solved the problem (just don't ask me why :-)).

256. Atari User Group Meeting - Wed July 8/92

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 17:36:07 UTC
From: daroloso@math.waterloo.edu
Message-ID: <Br14w9.1s5@math.waterloo.edu>
Source record: 220014
Cross-posted to: uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit,kw.micro,ont.micro

In July, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have an informal general meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our disk-of-the-month.
Our 8-bit library is also available at this meeting.

We will also give attendees the July issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, July 8, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

257. Using SC1224 with VGA on IBM

Newsgroup: comp.sys.atari.st

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm posting this for a friend. You can reply to me (I'll forward) or directly to him at bouv@ncc1701.psu.edu.

Posting follows:

Hello Everyone,

First off, I would like to say that I am by no means a regular reader of this newsgroup, so I apologize if this sort of project has been discussed before at length. Also, I would request that responses be emailed, since I don't really have the time to wade through the volume of postings in this group. Thanks!

I have been a long time Atari fan and owner (way back to the 400 days..) and I currently have a 1040STf, with both the SM124 and SC1224 monitors.

Recently I have been considering building a 386 PC compatible system and looking at component prices, it seems that over half my costs would go towards a decent VGA color monitor.

Since the SC1224 is an analog RGB monitor, I have been thinking that it might be possible to use it for VGA. Does anyone out there know if this is possible ?

I would hope it could be as simple as making a new cable and matching the pin outs (with the exception of the audio and some others).

Has anyone out there had any experience with doing this sort of thing?

Thanks for your time.
-Mark

258. Sony KV-1311CR TV/RGB Monitor, ST compatible, $225.

It might not be the XBIOS call that crashes your system, it might be that you are getting another interrupt while you're still handling the last one.

Try this :

```
INTERRUPT:
tst.b busy
bne exit
move.b #1,busy

{Your routine}

clr.b busy
EXIT:
rte (or whatever)

busy dc.b 0
```

No, they are some small diffrences that may cause some problems. For one
you need the latest TOS version (before 2.05 I believe)
The main difference is the the width of the adress bus (32 bits versus 24)
old TOS version and some older programs use the highest byte to store
some extra info in the address which is interpreted as addressing bits
on the 68020. The second problem may be programs that install themself in
some exception vector since the 68020 may use different sized stackframes
on some exceptions this may cause problem.

Most well behaving programs however will run without any problem.

266. Wanted.. PD verified 68030+68882 FP lib (Atari TT)

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 21:26:57 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1992Jul07.212657.33590@bas-a.bcc.ac.uk>
Source record: 220016

Does anyone know of a public domain/freeware verified IEEE floating point library for the 68030 with a 68882 co-processor?

After doing many tests PML (Fred Fish's Portable Maths Library) isn't quite right and the version on atari.archive doesn't compile with GCC 1.40 or 2.1 (as barfs at some of the assembler) with the 68881/2 option defined.

If you know of any, even if they aren't for the ST/TT (I doubt they would be), please tell me.

Thanks in advance,

Steve

> How can I find out how much memory was put in when I had the ram upgraded?

Well, just write a very small program that prints the result of Malloc(-1). The BIOS Malloc function returns the size of the largest unallocated chunk of RAM when it's passed -1. Be sure to reset your ST and disable all of your accessories and such-like first... It won't be precise, but pretty close.

(if you had a 520ST, a "1 Meg upgrade" usually means to bring you up to 1.5MB total, but who knows?)

> ---
>

This is interesting. So far I have been told with absolute certainty
that the software program both works and does not work, and the hardware
modifications both work and do not work.

It was mentioned above that characters were lost. Was that only when the
speed approached the maximum speed, or was that all the time? Did you
have RTS/CTS working and active when you tried it? I noticed dropped
characters and garbage on the screen when I turned off RTS/CTS on my

Supra 2400+ and sent a stream of text at it. Things went fine until the modem started receiving too fast for the computer to handle. Instant garbage...:) This was when I first got the modem. I don't see why the same thing shouldn't happen with faster modems. The principle should be the same?

Does anyone have any comments or help to add? When I get the modem, I'd like to be able to use it to it's full advantage...

270. Spectre GCR on a TT (again)

Newsgroup: comp.sys.atari.st
Date: 1992-07-07 23:07:49 UTC
From: ens@ccu.umanitoba.ca
Message-ID: <1992Jul7.230749.29435@ccu.umanitoba.ca>
Source record: 220020

Thanks to everyone that responded after my last query about a GCR on
a TT. Most informed me about a hardware modification necessary for
the GCR. I got a copy of the document and made the modification
but I still get the same behaviour:

I have a new TT with TOS 3.06, and a 1.4M floppy and 10 Mbyte ST RAM.
I connected the (modified) GCR and connected a HD containing Spectre
3.0 and a MAC partition to the ACSI port. With or without the Cache
on, Spectre gets up to the "Welcome to Macintosh" screen and then
freezes. The GCR and HD work fine on a 1040.

Is it relevant that the GCR test fails even though I am not using
the floppy drive at this stage?

If anyone has more ideas I would be happy to hear them.

Werner Ens
ens@ccu.umanitoba.ca

273. Help with IBM clone formatting -> ST Single Sided

Newsgroup: comp.sys.atari.st
Date: 1992-07-08 05:47:35 UTC
From: dont@klic.rain.com
Message-ID: <1992Jul8.054735.9647@klic.rain.com>
Source record: 220029

IBM clone has Teac 1.44 meg b drive with Adaptek 2732b controller.

I was given instructions on formatting disks on an IBM clone
to be read on an ST. I did it and it worked just fine.

Then I needed to do the same thing for another ST. I did it,
mailed the disks, and they said they couldn't be read. I
repeated the process, same result. I asked over the net, got
a different set of instructions, tried it again, no luck.

Then someone else mentioned that there might be single sided
disks involved. Snews to me, the instructions said nothing
about anything like this, everyone just said "do this".
Turned out the first ST had double sided disks.

Ok, so the second destination does have single sided disks.
Grab the IBM clone, MSDOS v 3.3, and try
format b: /1
to format one side of a disk, did this once with 5 1/4" disks.
Got an error message
Parameters not supported by drive
Format Failure
Ask half a dozen people, no luck. Finally try
device=C:\driver.sys /d:1 /h:1 /f:1
in config.sys, which seems to make an e drive that is 360k
and seems to only have one head when I
format e: /n:9 /t:80
Fill up the disk, go find an ST to test the disks, but it has
double sided disks. It can read the disks just fine. Mail
the disks, can read part of the directory, part of one file
and then crashes the machine.

Take two blank disks to an ST and ask the person to format
them for single sided. Does this without problem, and copies
my data onto the disks. Bring the disks back and the IBM clone
doesn't see them as empty disks, as I thought I had seen before,
but now doesn't even seem to think the disks are formatted.

Will someone please take pity on me, explain what I am doing
wrong, and tell me where I can get the tools to do this, or
email a uuencoded something that will do this on an IBM clone?

(I was told all about the 3? bytes in the boot sector that are
supposed to be the issue between the IBM clone and ST. But I
was told that this was only a problem going from ST TO IBM clone.
I was told about the IBM clone seeing ST disks as blank, and this

is what I thought I saw at an earlier time. For what it is worth
both the IBM clone and ST seem to be reading and writing disks
within their species without problem)

Thank you for your assistance

Source record: 220046

HI netters,

Can someone help me with the following questions please.

[1] How do I get the MGR.RC to configure with windows OPEN and
software running from the shell in the windows.

[2] How do I initiate the termcaps in MGR (from the mint or mgr RC?)

If someone could email me some sample MiNT and MGR .rc files so I can
look at them that would be great.

[3] Can someone recommend a good terminal program (in TOS not GEM) that
is MiNT aware and will allow several copies to be run in MGR windows
so I can monitor various serial devices here. (I have used te in
Gulam but it not well behaved on this Mega ST and crashes alot).

Thanks for your help in advance .....

>a shame: arguably the consistently best software for the ST
>had the MicroProse name on it.
>
>(I got the above info from a MicroProse (UK) rep a few days ago.)

I can well believe that you got the last part from a MicroProse rep. You certainly didn't get it from anyone who owns, for example, "F-19 Stealth Fighter". Rather than post the full list of complaints, I'll content myself on this occasion with commenting on a few things said on the back of the box.

"With dazzling graphics and authentic, real-world scenarios, F-19 creates action-packed excitement that keeps you coming back for more!"
The first three words are accurate. The "real-world scenarios" include such things as destroying a Soviet fuel dump during the Cold War.

"Hundreds of strategically-accurate missions."
Of which you only see a handful. In the Persian Gulf, for example, at least half the time I keep getting the same mission to destroy one missile boat and photograph another.

"Realistic bridges, carriers, terrain and targets."
Most of which you can fly straight through. The realistic terrain consists of flat land with a few identical mountains scattered round the place.

"Latest technology in electronics/weapons."
Including laser-guided cluster bombs. Even the USAF aren't stupid enough to put a laser-guidance system on a weapon which scatters bomblets over a wide area; sort of like putting a telescopic sight on a sawn-off shotgun.

"Intelligent enemy threats and weapons."
Such as enemy aircraft which don't fire at you.

"Unique threat displays and tracking systems."
So unique that not only do other games not have them, neither does the USAF. Actually, that's not true. Other games do have them. Most of

MicroProse's flight simulators, for a start.

And when I reported a list of bugs, MicroProse's responses were a combination of "It doesn't affect the game", "That's a feature, not a bug" and "We play-tested it for hours, and that doesn't happen". And from email exchanges I've had with other people, all the above apply to the Amiga version of the game as well. But not to the original PC version. My guess is that MicroProse have decided to fire the ST programmers to save themselves further such embarrassment.

Source record: 220032

Please help me to start zoo21.ttp. arc602.ttp starts unpacking when using parameters "x <filename>" but what is the parameter to start unpacking with zoo21.ttp?

When I start zoo21.ttp without parameters it just terminates without giving me any hints on usage. arc602.ttp shows a help listing for about 400ms (!!!) before it terminates. I was just lucky to see the parameter "x" for unpacking in the listing. Is this normal?

I know there are some documentation in zoo21bin.zoo (I read FAQ_Software), but zoo21bin.zoo has to be unpacked using zoo21.ttp, so ..... It seems to me that everything that could help me to start zoo21.ttp is archived with zoo.

>the program does not use priviledged intructions in user mode?)

No. Some instructions are REALLY faster on a >68000, especially the
bit shifts and arithmetic ones. So it's not just *more* instructions
on those CPU's and a higher clock that makes them faster. Even programs
not specifically written for the new processors can benefit (or, in
your case, suffer) from the speed increase. This is why a 68030@32
board sometimes shows 4000% values on some benchmarks. And this is why
some of those >68000 boards have a good old 68000@8 mounted on them,
to ensure a 100% compatible switchdown. You could also look at 68000
@ >8 MHz. There are even 25 MHz ones which make your ST fly!

Message-ID: <86010033@hpbbrd.bbn.hp.com>
Source record: 219909

> (Sorry, can't look up the name of that capability right now - our central file
> server is down, so I can't access Emacs and its info system. Arrgh.)

OK, here's the relevant entry from the Termcap documentation:

`xt'
Flag whose presence means that the ASCII tab character may not
be used for cursor motion. This flag exists because old
programs assume, when the `ta' capability is missing, that ASCII
tab can be used for the purpose. We use `xt' to tell the old
programs not to use tab.

New programs should not assume any default for `ta', so they
need not look at `xt' in connection with cursor motion. Note
that `xt' also has implications for standout mode (*Ref
Standout::.). It is obsolete in regard to cursor motion but not
in regard to standout.

In fact, `xt' means that the terminal is a Teleray 1061.

Have fun,

Jens.

>(flames off)

Why should Atari _Germany_ a lot of money to Wordperfect, when there are
a _lof_ of wordprocessing packages from Germany that work just fine?
WP 4.1 was a failure in Germany, and it's simply unfair to blame Atari
Germany for that. What do you think all there small german software companies
(like Application Systems, Shift, Compo (not german...) and so on) would
say when Atari _would_ bundle Wordperfect?

From: jawalsh@copper.ucs.indiana.edu
Message-ID: <Br2pr4.66z@usenet.ucs.indiana.edu>
Source record: 220035

I'm curious about the Atare ST. I don't want anyone to spend a lot of time on this, but I'd appreciate a brief overview and answers to some of the following questions. I know the Atari is supposed to be exceptionally good with midi and music software--something I'm interested in. That's all I know. So, why would someone get an Atari rather than a Mac or PC? Can one run DOS (or OS/2 or Windows) on an Atari? What's it known for besides being good for music? How powerful are they (or at least the new ones) compared to a 386 or a 68030? How much do they run?

Thank you to all who respond.

John

The SLM804 is the old, big and slow one, but it's possible to upgrade it to
300x600 DPI.
The SLM806 is the newest one on sale. It's faster (in use, but not technically)
and it's cheaper
1.998 DM with a 4 year warranty

The SLM604 might be released on the ATARI-Fair in Duesseldorf (21. -23.8).
It is said to be a SCSI-Printer (even smaller). And cheaper (under 2000
list-price; list for SLM806 is 2498DM

Yes. Microware occasionally sells an ST copy of OS-9. It costs over $500, but I don't remember the exact price. The Microware rep had an interesting story about visiting Atari for negotiations about releasing a version of OS-9 with the new machines. Turned out Atari wanted it for next to free because the machines are priced so near to recurring costs.

289. 3270 Emulation. Docu needed.

Newsgroup: comp.sys.atari.st
Date: 1992-07-08 16:59:47 UTC
From: wwc@vsnhda.cern.ch
Message-ID: <1992Jul8.165947.12791@dxcern.cern.ch>
Source record: 220040

I'd need all avaible information about the 3270 terminal emulation.
With the great SCC chip used in the TT and MEGA STE series, a direct
link to a 3270 host should be possible. Does anybody know, where to get
information about this emulation?

Thanks,
Wolfgang Wander
.

293. Disassembly - GEN ST

Newsgroup: comp.sys.atari.st
Date: 1992-07-08 19:44:46 UTC
From: lombardo@odin.unomaha.edu
Message-ID: <lombardo.710624686@odin>
Source record: 220047

Hello everyone!

Could someone please give me an introduction on how to disassemble a program using Mon ST (included with GEN ST). I have tried to disassemble even MY OWN programs, but for some reason I can't get it down. I have studied the GEN ST manual, and it gives info on the files header information, and I tried using that to differentiate between the main program code and the programs data.

For example:

```
move.l #text,-(sp)
move.w #9,-(sp)
trap #1
addq.w #6,sp

clr.w -(sp)
trap #1

text: dc.b 'This is this amazing programs data.',0
```

Now, if I assembled the above program to disk, and somehow lost it's precious source code (I betcha want this code, eh TLB? :)

How do I disassemble it so I get the above in a .S file? Does the programs header info have anything to do with this?

Ahhhh, btw, I thought I would slip in another question related to asm... what does pc relative mean, when is it used, why is it used and when do I have to use it? :)

The 3270 (all 327x family) hardware is not a usual serial communications device; connections are made with coax cable, not twisted-pair. You can get hardware devices that convert the coax's signals to standard RS232 signals, but all such devices I've seen also do protocol conversion so that you can hook a standard ANSI, VT100, or whatever, terminal to them. (IE, it removes the need to emulate 327x commands.)

The only source I know of for full information on the 3270 hardware and command set is IBM. (And generally their manuals are NOT cheap.)

No, letting him suffer means letting him live-- which you do not want to do.
True, killing him releases hordes of Purple worms, but they are by no means
neverending. Once you destroy all the worms that come after you, you'll
discover the exit to level four in the back of the room that they come from.

>any other changeable parts...

>Maybe that shouldn't say "I'm just curious" up top but "I'm just a little bit
>

Quickly, there are two Atari laser printers, the SLM804 and SLM605.

The SLM805 is the larger and older of the two, and currently is
being sold for $799.

The SLM605 is a smaller, trimmer printer, although only prints 6
pages per minute, as opposed to the 8 pages per minute that the
SLM804 was rated at. It is being sold for $899

(Prices from a recent B&C Computervisions catalog)

The SLM804 and SLM605 use different drums, and parts aren't really
interchangeable.

Oh, I forgot to mention, the prices quoted above INCLUDE
Ultrascript.

Well, this is probably what you didn't want to hear, but here's my
suggestion.

How about Atari's PTC1426 monitor? It is the monitor that graces
the brochure for Atari's ABC line of 386SX and DX computers, and is
also compatible with the Atari TT/030.

ca806@cleveland.Freenet.Edu (Roger M. Selby) writes:
>
>Does anyone know how to convert jpg files into something useable
>like a gif or spectrum format?

The version 3 jpeg utilities are available on atari.archive in the graphics directory as jpegv3.zip. DJPEG.TTP will convert JPG pictures to GIF format. It can require quite a bit of memory sometimes for larger picures, but it does have a memory limiting feature that is supposed to help with that (though I have never gotten it to work right.)
From there, DMJGIF (also in the graphics directory as dmjgif3.lzh) is, IMHO, the best shareware (or anywhere) program for converting GIFs to SPC. I have also found fastgif (graphics/fastgif.lzh) to be very valuable in peforming a quick conversion (less than 20 sec most times) in order to view the picture before committing the time that DMJ gif takes to do a more detailed conversion (though fastgif is better than most other gif converters).

I think this question should go into the FAQ (Steven?). I've seen this question quite a few times now.

6 months is TOO LONG?! Maybe you should ask Irving and Mehdi
about Commodore Ranger machine!! After many many years WHERE
is it?? Apple Computer is making computers every 6 months
and specs look like enginneers spend only SIX MINUTES designing
computer! Maybe you know some company selling 68030, DSP, SCSI 2,
LAN, MIDI, 16 bit stereo input/output, 386 slot, superVGA, blitter,
video overlay, 1.44 MB floopy, 4 joystick, AND $700-900 price???

IF you are buying NEW computer every 6 months WHAT company are
you buying from??

314. PageStreem Update

Newsgroup: comp.sys.atari.st
Date: 1992-07-09 11:25:27 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1992Jul9.112527.5974@peponi.wcc.govt.nz>
Source record: 219921

Well I have just uploaded the Pagestreem Update from 2.1 to 2.2b.

NOTE: this is ONLY for the USA version..

These files are now in the atari/new on A.A. and are called
patch.arc printers.arc and modules.arc, you will need all of these
files for the update, there sizes are 296k, 43k and 74k bytes
in there archive state..

If you are tring to update your master program disk, the updates
will not fit on the disk as provided, format a disk 10/80
and then copy all the files onto it, then the update will just fit,
there are no problems with any other disks..

These files are the same as the files on GEnie provided by SoftLogic..

Roger..... sheppard_r@kosmos.wcc.govt.nz

Hi.
I'm trying to get Pcditto (software) to run on my 1040,1meg 1 floppy mono screen.

When I start the program up, the screen goes blank and the drive just keeps spinning.

I presume it's trying to boot MSDOS. The disk is an MSDOS 5.0 boot disk.

Any ideas?

316. ST Keyboard Problem

Newsgroup: comp.sys.atari.st
Date: 1992-07-09 12:09:16 UTC
From: ae258@cleveland.Freenet.Edu
Message-ID: <1992Jul9.120916.27961@usenet.ins.cwru.edu>
Source record: 219920

Consistently, after about 10 minutes of running my ST 1040, which
is connected to a SUPRA 30 MEG hard drive, while running a word proceccor
processor, the keyboard begins giving off unexpected characters.
For example, when I type a "G", I get a "&" or some other
character. The whole keyboard does this. I ran the word proc-
essor without the hard drive and the keyboard is just fine
, it does not go crazy. Does anyone know what the problem is?
Is my hard drive messed up? I took the machine , the ST and hard drive
drive to work, and ran the word processor. It did the same
thing, the keyboard was going crazy. After it goes crazy,
I turn the machine off, and back on. It works for a while
then goes crazy again. Help! Thank you.

>>
>>Thom
>

Six months lagging behind is an eternity in the computer world. Six months on *design* is a blink of an eye. Apple has crowed lately about how fast they can make a machine appear in the market, yet at best, they can't beat six months. I've been hearing about the ci/si replacement for about six months now, and about as long as the Falcon. The falcon is at least in production!

I just hope the machine is as hot as they are making it out to be...but time will tell that. If I don't have specifics by September 26th, THEN I'll start hollering. (Atari has promised to unveil the falcon once again, on the site they introed the ST, on September 23. I'm giving them a few days to get the info out.)

318. Minix 1.5.10.3 Problem

Newsgroup: comp.sys.atari.st
Date: 1992-07-09 14:23:08 UTC
From: malay@sae.com
Message-ID: <1992Jul9.142308.5751@sae.com>
Source record: 219926

Hi all,

I finally got around to applying patches 1,2 & 3 to MINIX 1.5 - I recompiled the libraries, commands and built a new kernel. When I run "diskrtc icd" I get the following error message:

bmsrtc: ASSERT(idx=9 0>=1 && 0 <=12) fatal

I set "CLOCKS=-DCLOCKS" in the kernel Makefile.

The interesting thing is that if I use my previous kernel with the new commands then "diskrtc icd" works without errors so it appears to be a kernel problem. Is there something else that needs to be set??

>I've been hearing about the Falcon for six months or more... I assume
>the machine is real... but why did they wait so long? 6 months is an
>eternity in the computer world?
>
>Thom
>
>

You have been hearing about it for so long BECAUSE Atari users are the
best informed when it comes to rumors.

I mean when it comes to information, Atari users are the best.

Atari has not formally announced the Falcon yet so I'm not upset by it.
Remember, Greg Pratt, former president of Atari U.S. stated at the November,
1991 Chicago Atari show that he didn't expect the machine to appear
in the United States until early 1993. This is so that developers have
time to put out some good stuff.

If Atari announces it in late September and 90-days has passed and I still
can't purchase it, I'll start complaining then.

This is would be the end of December.

Also, anyone that brings up the features and price of the Falcon in argument
with someone else, don't. Chances are that they are both wrong.

I'm hoping a version of Multi-TOS is almost finished. I'm also hoping
that they put the base of it in ROM and only add things to it with disk.
Why take up extra RAM room when you can put it in ROM?

Source record: 219933
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

Can anyone tell me what sort of hard drive do you need for an atari STFM with TOS 1.4?
I basically need to know everything.
How much are they? (approx. 30-40 mb)
Do you need any cables, adaptors etc?
Do these come with the drive and if not how much are these?
How fast are they compared to a floppy?

Also, I am looking for a Desk Top Publisher that will work with a Canon BJ10ex printer. It will preferably have a variety of fonts and sizes and be capable of including good quality pictures. (Will I need another program to draw these pictures? again advice will be greatly appreciated)

Any reasonable and cheap offers for either of these will be appreciated as well. (I can afford up to about 100 pounds for the DTP and no more than about 250 pounds for the hard drive)

A list of good places to buy these new from will be helpful as well but at the moment I don't know what I'm looking for.

Thanks,
Phil

324. SHEET.PRG spreadsheet program...HELP!!!

Newsgroup: comp.sys.atari.st
Date: 1992-07-09 17:16:14 UTC
From: richardson@vaxr.sscl.uwo.ca
Message-ID: <1992Jul9.131614.1@vaxr.sscl.uwo.ca>
Source record: 219929

Any SHEET.PRG users out there...help! I acquired SHEET from STFormat magazine and really hadn't looked too much at it. I had a couple of spare hours this week so I looked at a couple of the examples. It seems like an excellent spreadsheet package, enabling basic commands to be used, extensive editing etc. and imports Lotus stuff...BUT! I tried getting the prog to read an external data file (ASCII) and put the data in cells...no luck! One of the example supposedly does this, but damned if I could get it to work! Has anyone tried this package and got imported data to be entered correctly...anyone?

Also, while i'm asking for help :^) I haven't been too successful in getting the VIEWPORT or WINDOWS commands to work very well (okay not at all!). When I try to get stuff printed in a window it overwrites the display and looks rather messy. Anyone got this sussed out either? This post sounds rather pathetic and begging-like and i'm really not an idiot [:^)], but I am very definitely SHEET-illiterate! Thanks in advance for any help,
T.T.F.N.

329. Hard Drive and Accelerator Questions (separate)

Newsgroup: comp.sys.atari.st
Date: 1992-07-09 19:09:33 UTC
From: elvis@watserv.ucr.edu
Message-ID: <5316@ucru2.ucr.edu>
Source record: 219934

Hi,
I have a couple of questions that I was hoping someone could answer.
First, I was recently given two SCSI drives (the person wasn't sure if they worked or not, so he gave them to me). They both , as it turns out, so I now have three hard drives. This leads to my question: can I have all three hooked up to a single controller? I have a Supra controller (software version 3.21 if that matters). The SCSI cable with it only has connectors for two drives, but I don't know if that's just because they thought no one would have more than two drives, or if the controller can only handle two devices.
My second question is actually more of a request. I'm interested in adding an accelerator to my 1040st. I've heard fairly good things about the adspeed from ICD, but have also seen ads for ones from turbo-technologies (I think): the t-16, t-20 and t-25. Does anyone know anything about these? Are they reliable? Have nifty features? Dirt cheap beyond all belief?
Or does anyone know of other accelerators in the low price range (can't quite afford an 030 at the moment...)?

Thanks for any help,
Andrew Cullum (elvis@watserv.ucr.edu)

FSM-GDOS is a complete replacement for the slow GDOS. But it fully supports the original for compatibility purposes.

Technically, FSM-GDOS HAS been released, but as of yet, can only be purchased when it is combined with other packages. (As GDOS was released with Degas Elite etc.) - in the April ST-Format, there is a large column on the subject in the first few pages. Telling how to get a copy of it.

From: booga@ibmpa.awdpa.ibm.com
Message-ID: <1992Jul9.203335.6355@ibmpa.awdpa.ibm.com>
Source record: 219938

It would seem this is an age old question, but I've slogged through
the last months worth of articles in c.s.atari.st and didn't find much
information.

I've got an old 1040ST (before there was a distinction between STfm, STE, etc)
that I want to hook to my TV. The connection can be through RF or NTSC
video, I don't care. I understand the problem is non-trivial, so I'm
willing to spend a little $$ to make this work.

A couple products have been loosely mentioned in the group: VideoKey
(company out of business), CVBS-video (??), and SCART-connector (??).

If someone could tell me about these or other things I might use, that
would be great (features, recommendations, addresses and mail-orders)
If you've got something you want to sell, let's talk.

Thanks

Well, FSMGDOS is and isn't released. You can get it (as I have) if you
purchase Wordflair II from Goldleaf Publishing. When I bought it, FSMGDOS
was available as a $US35.00 upgrade. The set of disks contains FSMGDOS,
FONTGDOS (new version of GDOS -- bitmap fonts only), and 4 typefaces
(Lucida Sans Typewriter, Lucida Roman, Lucida Sans Roman (all in normal,
bold, italic, and bolditalic), and Lucida Calligraphy (normal only)).

I'm not familiar with O-line fonts, so I can't really say if they're
compatible, but I doubt it. As far as I know, FSMGDOS uses PC-style
UltraScript fonts (that's what I've read, though it doesn't actually say
in the documnetation; the file extensions are .QFM, if that helps).

I have no idea when of even if Atari will be making FSMGDOS generally
available, or why they've chosen to distribute it this way. The fonts
are a VAST improvement over the old GDOS, and even look pretty good on
a 9-pin dot-matrix printer! I've had some trouble with bombs in Wordflair II,
but I'm not sure yet who to blame: FSMGDOS, TOS 3.01 (slightly incompatible),
or Wordflair II. On the whole, I'm quite happy with it.

>
>p.s Anyone in the know: is it a straight GDOS replacement or simply an
>'upgrade'

It's a straight replacement, but is backward compatible (can still use bitmap
fonts and doesn't crash what little old GDOS software I have :-)).

>I mean when it comes to information, Atari users are the best.

That's because our machine is so not as supported as other platforms. Atari users MUST get (or fabricate) their own information...

>Why take up extra RAM room when you can put it in ROM?

..because it's more difficult to upgrade. Sure it's a good idea now, but what will happen when something new is in the works? Then you're going to have to buy new roms and compatibility problems are going to rampant.

Alan

336. How can I use my own fonts in programs?

Newsgroup: comp.sys.atari.st
Date: 1992-07-09 23:49:29 UTC
From: paetau@mits.mdata.fi
Message-ID: <1992Jul9.234929.27995@mits.mdata.fi>
Source record: 219943

How can I force a program to use a different font set than the
original one? And in what kind of format are the fonts stored in
memory?

I'm considering selling my Mega STE and getting a TT. It has 4meg RAM, 50meg hard drive, and the FPU. It's in great condition and I have all the original packaging and manuals. Anyone interested? Leave e-mail. Serious offers only please.

338. GEM docs

Newsgroup: comp.sys.atari.st
Date: 1992-07-10 03:14:12 UTC
From: paulb@world.std.com
Message-ID: <Br5Kzp.2Gs@world.std.com>
Source record: 219948

I'm trying to find some serious docs, possibly mail order, preferably originating in USA, that will help me write graphics and sound routines in C (GCC). Probably something explaining line-a, etc. would be nice.

Does anyone have/know where to obtain such docs? New England has little available on the subject.

Please reply thru email, unless there is such an amazing doc that everyone would like to read it!
Thanx in advance

-paulb paulb@world.std.com

339. Dungeon Master. (Ta!)

Thanks to the dozens (literally) that gave me info on Dungeon Master.
For sorting out the end-of-level 'puzzle'. NO more please!! (grin!)

Thanks very much guys! Got it sussed now, just sorting out the
Fire-staff at the moment!

If I did think that, would I have written what I did? :)

I can not think of any other explanation for what happened, since the problem went away immediately after I turned on RTS/CTS. That isn't really important, though, since my original question was whether or not it was possible to make the ST take data at 38,400 baud since I am planning on purchasing a 14.4K modem and the fastest speed the ST can now receive data at is 19.2K. Since the modem compresses text as it receives it, it is fairly likely that the throughput might exceed 19,200 baud (in which case I am losing valuable speed.)

Thanks for your interest, though...

341. Supra SCSI (Atari) Board For Sale (build a hard disk)

Newsgroup: comp.sys.atari.st
Date: 1992-07-10 07:48:37 UTC
From: bmaraldo@watserv1.waterloo.edu
Message-ID: <Br5xp2.KHI@watserv1.waterloo.edu>
Source record: 219950
Cross-posted to: misc.forsale,kw.forsale,uw.forsale,ont.forsale,comp.sys.atari.st

For Atari ST:

I have a SCSI adapter board for a Supra hard disk system for sale.
The board plugs into a standard multi-pin connector on a SCSI hard disk.
All that is required is an appropriate drive and power supply. I'll
include a case (and a broken power supply). The card works well. It comes
with a utilites disk. For more info please email. I'd like maybe $60
for this board or best offer (1.22CDN$ = 1US$).

Well, perhaps this "little" docu will help you...

sincerely,
Chris

ZOO(1) REFERENCE MANUAL ZOO(1)

NAME
zoo - manipulate archives of files in compressed form

SYNOPSIS
zoo {acfDeghHlLPTuUvVx}[aAcCdEfghImMnNoOpPqSu1:/.@n+-=]
archive [file] ...
zoo -command archive [file] ...
zoo h

DESCRIPTION
Zoo is used to create and maintain collections of files in
compressed form. It uses a Lempel-Ziv compression algorithm
that gives space savings in the range of 20% to 80% depend-
ing on the type of file data. Zoo can store and selectively
extract multiple generations of the same file. Data can be
recovered from damaged archives by skipping the damaged por-
tion and locating undamaged data with the help of fiz(1).

This documentation is for version 2.1. Changes from previ-
ous versions are described in the section labelled CHANGES.

The command zoo h gives a summary of commands. Extended
multiscreen help can be obtained with zoo H.

Zoo will not add an archive to itself, nor add the archive's
backup (with .bak extension to the filename) to the archive.

Zoo has two types of commands: Expert commands, which con-
sist of one command letter followed by zero or more modifier
characters, and Novice commands, which consist of a hyphen
(`-') followed by a command word that may be abbreviated.
Expert commands are case-sensitive but Novice commands are
not.

When zoo adds a file to an existing archive, the default
action is to maintain one generation of each file in an
archive and to mark any older generation as deleted. A
limit on the number of generations to save can be specified
by the user for an entire archive, or for each file indivi-
dually, or both. Zoo deletes a stored copy of an added file
```

if necessary to prevent the number of stored generations from exceeding the user-specified limit.

Deleted files may be later undeleted. Archives may be packed to recover space occupied by deleted files.

All commands assume that the archive name ends with the characters .zoo unless a different extension is supplied.

Novice commands

Novice commands may be abbreviated to a hyphen followed by at least one command character. Each Novice command works in two stages. First, the command does its intended work. Then, if the result was that one or more files were deleted in the specified archive, the archive is packed. If packing occurs, the original unpacked archive is always left behind with an extension of .bak.

No Novice command ever stores the directory prefix of a file.

The Novice commands are as follows.

-add Adds the specified files to the archive.

-freshen
Adds a specified file to the archive if and only if an older file by the same name already exists in the archive.

-delete
Deletes the specified files from the archive.

-update
Adds a specified file to the archive either: if an older file by the same name already exists in the archive or: if a file by the same name does not already exist in the archive.

-extract
Extracts the specified files from the archive. If no file is specified all files are extracted.

-move
Equivalent to -add except that source files are deleted after addition.

-print
Equivalent to -extract except that extracted data are sent to standard output.

-list
Gives information about the specified archived files including any attached comments. If no files are

specified all files are listed. Deleted files are not
listed.

-test
Equivalent to -extract except that the extracted data
are not saved but any errors encountered are reported.

-comment
Allows the user to add or update comments attached to
archived files. When prompted, the user may: type a
carriage return to skip the file, leaving any current
comment unchanged; or type a (possibly null) comment
of up to 32,767 characters terminated by /end (case-
insensitive) on a separate line; or type the end-of-
file character (normally control D) to skip all remain-
ing files.

-delete
Deletes the specified files.

The correspondence between Novice and Expert commands is as follows.

Novice Equivalent
Command Description Expert Command
____
-add add files to archive aP:
-extract extract files from archive x
-move move files to archive aMP:
-test test archive integrity xNd
-print extract files to standard output xp
-delete delete files from archive DP
-list list archive contents VC
-update add new or newer files aunP:
-freshen by add newer files auP:
-comment add comments to files c

Expert commands

The general format of expert commands is:

zoo {acfDeghHlLPTuUvVx}[aAcCdEfghImMnNoOpPqSu1:/.@n+-=]
archive [file] ...

The characters enclosed within {} are commands. Choose any
one of these. The characters enclosed within [] just to the
right of the {} are modifiers and zero or more of these may
immediately follow the command character. All combinations
of command and modifier characters may not be valid.

Files are added to an archive with the command:

zoo {au}[cfhIMnPqu:+-] archive [file] ...

Command characters are:

a Add each specified file to archive. Any already-archived copy of the file is deleted if this is necessary to avoid exceeding the user-specified limit on the number of generations of the file to maintain in the archive.

u Do an update of the archive. A specified file is added to the archive only if a copy of it is already in the archive and the copy being added is newer than the copy already in the archive.

The following modifiers are specific to these commands.

M Move files to archive. This makes zoo delete (unlink) the original files after they have been added to the archive. Files are deleted after addition of all files to the archive is complete and after any requested packing of the archive has been done, and only if zoo detected no errors.

n Add new files only. A specified file is added only if it isn't already in the archive.

h Use the high performance compression algorithm. This option may be used with either the add (a) or filter (f) commands to gain extra compression at the expense of using somewhat more processor time. Extracting files compressed with the method is usually slightly faster than those saved with the default method.

P Pack archive after files have been added.

u Applied to the a command, this modifier makes it behave identically to the u command.

The combination of the n modifier with the u modifier or u command causes addition of a file to the archive either if the file is not already in the archive, or if the file is already in the archive but the archived copy is older than the copy being added.

: Do not store directory names. In the absence of this modifier zoo stores the full pathname of each archived file.

I Read filenames to be archived from standard input. Zoo will read its standard input and assume that each line of text contains a filename. Under AmigaDOS and the **IX family, the entire line is used. Under MS-DOS and VAX/VMS, zoo assumes that the filename is terminated by a blank, tab, or newline; thus it is permissible for the line of text to contain more than one field separated by white space, and only the first field will be used.

Under the **IX family of operating systems, zoo can be used as follows in a pipeline:

find . -print | zoo aI sources

If the I modifier is specified, no filenames may be supplied on the command line itself.

+,- These modifiers take effect only if the a command results in the creation of a new archive. + causes any newly-created archive to have generations enabled. - is provided for symmetry and causes any newly-created archive to have generations disabled; this is also the default if neither + nor - is specified.

Files are extracted from an archive with the command:

zoo {ex}[dNoOpqS./@] archive [file] ...

The e and x commands are synonymous. If no file was specified, all files are extracted from the archive.

The following modifiers are specific to the e and x commands:

N Do not save extracted data but report any errors encountered.

O Overwrite files. Normally, if a file being extracted would overwrite an already-existing file of the same name, zoo asks you if you really want to overwrite it. You may answer the question with `y', which means yes, overwrite; or `n', which means no, don't overwrite; or `a', which means assume the answer is `y' for this and all subsequent files. The O modifier makes zoo assume that files may always be overwritten. Neither answering the question affirmatively nor using O alone will cause read-only files to be overwritten.

On **IX systems, however, doubling this modifier as OO will force zoo to unconditionally overwrite any read-protected files with extracted files if it can do so.

The O, N, and p modifiers are mutually exclusive.

S Supersede newer files on disk with older extracted files. Unless this modifier is used, zoo will not overwrite a newer existing file with an older extracted file.

o This is equivalent to the O modifier if and only if it is given at least twice. It is otherwise ignored.

p Pipe extracted data to standard output. Error messages are piped to standard output as well. However, if a bad CRC is detected, an error message is sent both to

standard error and to standard output.

/ Extract to original pathname. Any needed directories must already exist. In the absence of this modifier all files are extracted into the current directory. If this modifier is doubled as //, required directories need not exist and are created if necessary.

The management of multiple generations of archived files is done with the commands:

```
zoo gl[Aq]{+-=}number archive files ..
zoo gc[q]{+-=}number archive files ..
zoo gA[q]- archive
zoo gA[q]+ archive
```

The first form, gl, adjusts the generation limit of selected files by the specified value. If the form =n is used, where n is a decimal number, this sets the generation limit to the specified value. If + or - are used in placed of = the effect is to increment or decrement the generation limit by the specified value. For example, the command

```
zoo gl=5 xyz :
```

sets the generation limit of each file in the archive xyz.zoo to a value of 5. The command

```
zoo gl-3 xyz :
```

decrements the generation limit of each file in the archive to 3 less than it currently is.

If the A modifier is used, the archive-wide generation limit is adjusted instead.

The number of generations of a file maintained in an archive is limited by the file generation limit, or the archive generation limit, whichever is lower. As a special case, a generation limit of 0 stands for no limit. Thus the default file generation limit of 0 and archive generation limit of 3 limits the number of generations of each file in a newly-created archive to three.

The generation limit specified should be in the range 0 through 15; any higher numbers are interpreted modulo 16.

The second form of the command, using gc, adjusts the generation count of selected files. Each file has a generation count of 1 when it is first added to an archive. Each time a file by the same name is added again to an archive, it receives a generation count that is one higher than the highest generation count of the archived copy of the file. The permissible range of generation counts is 1 through

65535. If repeated manipulations of an archive result in files having very high generation counts, they may be set back to lower numbers with the gc command. The syntax of the command is analogous to the syntax of the gl command, except that the A modifier is not applicable to the gc command.

The third form, gA-, disables generations in an archive. Generations are off when an archive is first created, but may be enabled with the fourth form of the command, gA+. When generations are disabled in an archive, zoo will not display generation numbers in archive listings or maintain multiple generations. Generations can be re-enabled at any time, though manipulation of an archive with repeated interspersed gA- and gA+ commands may result in an archive whose behavior is not easily understandable.

Archived files are listed with the command:

zoo {lLvV}[aAcCdfgmqvV@/1+-] archive[.zoo] [file] ...

l Information presented includes the date and time of each file, its original and current (compressed) sizes, and the percentage size decrease due to compression (labelled CF or compression factor). If a file was added to the archive in a different timezone, the difference between timezones is shown in hours as a signed number. As an example, if the difference is listed as +3, this means that the file was added to the archive in a timezone that is 3 hours west of the current timezone. The file time listed is, however, always the original timestamp of the archived file, as observed by the user who archived the file, expressed as that user's local time. (Timezone information is stored and displayed only if the underlying operating system knows about timezones.)

If no filename is supplied all files are listed except deleted files.

Zoo selects which generation(s) of a file to list according to the following algorithm.

If no filename is supplied, only the latest generation of each file is listed. If any filenames are specified, and a generation is specified for an argument, only the requested generation is listed. If a filename is specified ending with the generation character (`:' or `;'), all generations of that file are listed. Thus a filename argument of the form zoo.c will cause only the latest generation of zoo.c to be listed; an argument of the form zoo.c:4 will cause

generation 4 of zoo.c to be listed; and an argument of the form zoo.c: or zoo.c:* will cause all generations of zoo.c to be listed.

L This is similar to the l command except that all supplied arguments must be archives and all non-deleted generations of all files in each archive appear in the listing.

On **IX systems, on which the shell expands arguments, if multiple archives are to be listed, the L command must be used. On other systems (VAX/VMS, AmigaDOS, MSDOS) on which wildcard expansion is done internally by zoo, wildcards may be used in the archive name, and a multiple archive listing obtained, using the l command.

v This causes any comment attached to the archive to be listed in addition to the other information.

V This causes any comment attached to the archive and also any comment attached to each file to be listed.

Both the V and v command characters can also be used as modifiers to the l and L commands.

In addition to the general modifiers described later, the following modifiers can be applied to the archive list commands.

a This gives a single-line format containing both each filename and the name of the archive, sorted by archive name. It is especially useful with the L command, since the result can be further sorted on any field to give a master listing of the entire contents of a set of archives.

A This causes any comment attached to the archive to be listed.

g This modifier causes file generation information to be listed about the archive. For each file listed, the user-specified generation limit, if any, is listed. For example, `3g' for a file means that the user wants no more than three generations of the file to be kept. In archives created by older versions of zoo, the listing will show `-g', meaning that no generation information is kept and multiple generations of the file are not being maintained.

In addition to the generation information for each file, the archive-wide generation limit, if any, is shown at the end of the listing. If generations have

been disabled by the user, this is so indicated, for example:

Archive generation limit is 3 (generations off).

For more information about generations see the description of the g command.

m This modifier is currently applicable to **IX systems only. It causes the mode bits (file protection code) of each file to be listed as a three-digit octal number. Currently zoo preserves only the lowest nine mode bits. Their meanings are as described in the **IX documentation for the chmod(1) command.

C This modifier causes the stored cyclic redundancy code (CRC) for each archived file to be shown as a four-digit hexadecimal number.

1 This forces one filename to be listed per line. It is most useful in combination with the f modifier.

/ This forces any directory name to be always listed, even in fast columnized listings that do not normally include any directory names.

+,- The - modifier causes trailing generation numbers to be omitted from filenames. The + modifier causes the trailing generation numbers to be shown, which is also the default if neither - nor + is specified.

Files may be deleted and undeleted from an archive with the following commands:

zoo {DU}[Pq1] archive file ...

The D command deletes the specified files and the U command undeletes the specified files. The 1 modifier (the digit one, not the letter ell) forces deletion or undeletion of at most one file. If multiple instances of the same file exist in an archive, use of the 1 modifier may allow selective extraction of one of these.

Comments may be added to an archive with the command:

zoo c[A] archive

Without the modifier A, this behaves identically to the -comment command. With the modifier A, the command serves to add or update the comment attached to the archive as a whole. This comment may be listed with the lA, LA, v, and V commands. Applying the cA command to an archive that was created with an older version of zoo will result in an error message requesting that the user first pack the archive with

the P command. This reorganizes the archive and creates space for the archive comment.

The timestamp of an archive may be adjusted with the command:

zoo T[q] archive

Zoo normally attempts to maintain the timestamp of an archive to reflect the age of the newest file stored in it. Should the timestamp ever be incorrect it can be fixed with the T command.

An archive may be packed with the command:

zoo P[EPq] archive

If the backup copy of the archive already exists, zoo will refuse to pack the archive unless the P modifier is also given. The E modifier causes zoo not to save a backup copy of the original archive after packing. A unique temporary file in the current directory is used to initially hold the packed archive. This file will be left behind if packing is interrupted or if for some reason this file cannot be renamed to the name of the original archive when packing is complete.

Packing removes any garbage data appended to an archive because of Xmodem file transfer and also recovers any wasted space remaining in an archive that has been frequently updated or in which comments were replaced. Packing also updates the format of any archive that was created by an older version of zoo so that newer features (e.g. archive-wide generation limit, archive comment) become fully available.

Zoo can act as a pure compression or uncompression filter, reading from standard input and writing to standard output. This is achieved with the command:

zoo f{cu}[h

where c specifies compression, u specifies uncompression, and h used in addition requests the high-performance compression be used. A CRC value is used to check the integrity of the data. The compressed data stream has no internal archive structure and contains multiple files only if the input data stream was already structured, as might be obtained, for example, from tar or cpio.

Modem transfers can be speeded up with these commands:

zoo fc < file | sz ... rz | zoo fu > file

General modifiers

The following modifiers are applicable to several commands:

c Applied to the a and u commands, this causes the user to be prompted for a comment for each file added to the archive. If the file being added has replaced, or is a newer generation of, a file already in the archive, any comment attached to that file is shown to the user and becomes attached to the newly-added file unless the user changes it. Possible user responses are as described for the -comment command. Applied to the archive list command l, the c modifier causes the listing of any comments attached to archived files.

. In conjunction with / or // this modifier causes any extracted pathname beginning with `/' to be interpreted relative to the current directory, resulting in the possible creation of a subtree rooted at the current directory. In conjunction with the command P the . modifier causes the packed archive to be created in the current directory. This is intended to allow users with limited disk space but multiple disk drives to pack large archives.

d Most commands that act on an archive act only on files that are not deleted. The d modifier makes commands act on both normal and deleted files. If doubled as dd, this modifier forces selection only of deleted files.

f Applied to the a and u commands, the f modifier causes fast archiving by adding files without compression. Applied to l it causes a fast listing of files in a multicolumn format.

q Be quiet. Normally zoo lists the name of each file and what action it is performing. The q modifier suppresses this. When files are being extracted to standard output, the q modifier suppresses the header preceding each file. When archive contents are being listed, this modifier suppresses any header and trailer. When a fast columnized listing is being obtained, this modifier causes all output to be combined into a single set of filenames for all archives being listed.

When doubled as qq, this modifier suppresses WARNING messages, and when tripled as qqq, ERROR messages are suppressed too. FATAL error messages are never suppressed.

Recovering data from damaged archives

The @ modifier allows the user to specify the exact position in an archive where zoo should extract a file from, allowing damaged portions of an archive to be skipped. This modifier must be immediately followed by a decimal integer without intervening spaces, and possibly by a comma and another decimal integer, giving a command of the form l@m or l@m,n (to list archive contents) or x@m or x@m,n (to extract files from an archive). Listing or extraction begin at position m in the archive. The value of m must be the position within the archive of an undamaged directory entry. This position is usually obtained from fiz(1) version 2.0 or later.

If damage to the archive has shortened or lengthened it, all positions within the archive may be changed by some constant amount. To compensate for this, the value of n may be specified. This value is also usually obtained from fiz(1). It should be the position in the archive of the file data corresponding to the directory entry that has been specified with m. Thus if the command x@456,575 is given, it will cause the first 456 bytes of the archive to be skipped and extraction to begin at offset 456; in addition, zoo will attempt to extract the file data from position 575 in the archive instead of the value that is found in the directory entry read from the archive. For example, here is some of the output of fiz when it acts on a damaged zoo archive:

```
****************
2526: DIR [changes] ==> 95
2587: DATA
****************
3909: DIR [copyrite] ==> 1478
3970: DATA
4769: DATA
****************
```

In such output, DIR indicates where fiz found a directory entry in the archive, and DATA indicates where fiz found file data in the archive. Filenames located by fiz are enclosed in square brackets, and the notation "==> 95" indicates that the directory entry found by fiz at position 2526 has a file data pointer to position 95. (This is clearly wrong, since file data always occur in an archive after their directory entry.) In actuality, fiz found file data at positions 2587, 3970, and 4769. Since fiz found only two directory entries, and each directory entry corresponds to one file, one of the file data positions is an artifact.

In this case, commands to try giving to zoo might be x@2526,2587 (extract beginning at position 2526, and get file data from position 2587), x@3090,3970 (extract at 3090, get data from 3970) and x@3909,4769 (extract at 3909, get

data from 4769). Once a correctly-matched directory entry/file data pair is found, zoo will in most cases synchronize with and correctly extract all files subsequently found in the archive. Trial and error should allow all undamaged files to be extracted. Also note that self-extracting archives created using sez (the Self-Extracting Zoo utility for MS-DOS), which are normally executed on an MS-DOS system for extraction, can be extracted on non-MSDOS systems using zoo's damaged-archive recovery method using the @ modifier.

Wildcard handling

Under the **IX family of operating systems, the shell normally expands wildcards to a list of matching files. Wildcards that are meant to match files within an archive must therefore be escaped or quoted. When selecting files to be added to an archive, wildcard conventions are as defined for the shell. When selecting files from within an archive, wildcard handling is done by zoo as described below.

Under MS-DOS and AmigaDOS, quoting of wildcards is not needed. All wildcard expansion of filenames is done by zoo, and wildcards inside directory names are expanded only when listing or extracting files but not when adding them.

The wildcard syntax interpreted by zoo is limited to the following characters.

* Matches any sequence of zero or more characters.

? Matches any single character.

Arbitrary combinations of * and ? are allowed.

/ If a supplied pattern contains a slash anywhere in it, then the slash separating any directory prefix from the filename must be matched explicitly. If a supplied pattern contains no slashes, the match is selective only on the filename.

c-c Two characters separated by a hyphen specify a character range. All filenames beginning with those characters will match. The character range is meaningful only by itself or preceded by a directory name. It is not specially interpreted if it is part of a filename.

: and ;
These characters are used to separate a filename from a generation number and are used when selecting specific generations of archived files. If no generation character is used, the filename specified matches only the latest generation of the file. If the generation char-

acter is specified, the filename and the generation are matched independently by zoo's wildcard mechanism. If no generation is specified following the : or ; character, all generations of that file will match. As a special case, a generation number of 0 matches only the latest generation of a file, while ^0 matches all generations of a file except the latest one. If no filename is specified preceding the generation character, all filenames will match. As a corollary, the generation character by itself matches all generations of all files.

MS-DOS users should note that zoo does not treat the dot as a special character, and it does not ignore characters following an asterisk. Thus * matches all filenames; *.* matches filenames containing a dot; *_* matches filenames containing an underscore; and *z matches all filenames that end with the character z, whether or not they contain a dot.

Usage hints

The Novice command set in zoo is meant to provide an interface with functionality and format that will be familiar to users of other similar archive utilities. In keeping with this objective, the Novice commands do not maintain or use any subdirectory information or allow the use of zoo's ability to maintain multiple generations of files. For this reason, users should switch to exclusively using the Expert commands as soon as possible.

Although the Expert command set is quite large, it should be noted that in almost every case, all legal modifiers for a command are fully orthogonal. This means that the user can select any combination of modifiers, and when they act together, they will have the intuitively obvious effect. Thus the user need only memorize what each modifier does, and then can combine them as needed without much further thought.

For example, consider the a command which is used to add files to an archive. By itself, it simply adds the specified files. To cause only already-archived files to be updated if their disk copies have been modified, it is only necessary to add the u modifier, making the command au. To cause only new files (i.e., files not already in the archive) to be added, the n modifier is used to create the command an. To cause both already-archived files to be updated and new files to be added, the u and n modifiers can be used together, giving the command aun. Since the order of modifiers is not significant, the command could also be anu.

Further, the c modifier can be used to cause zoo to prompt the user for a comment to attach to each file added. And the f modifier can cause fast addition (addition without compression). It should be obvious then that the command auncf will cause zoo to update already-archived files, add new files, prompt the user for comments, and do the addition of files without any compression. Furthermore, if the user wishes to move files to the archive, i.e., delete the disk copy of each file after it is added to the archive, it is only necessary to add the M modifier to the command, so it becomes auncfM. And if the user also wishes to cause the archive to be packed as part of the command, thus recovering space from any files that are replaced, the command can be modified to auncfMP by adding the P modifier that causes packing.

Similarly, the archive listing commands can be built up by combining modifiers. The basic command to list the contents of an archive is l. If the user wants a fast columnized listing, the f modifier can be added to give the lf command. Since this listing will have a header giving the archive name and a trailer summarizing interesting information about the archive, such as the number of deleted files, the user may wish to "quieten" the listing by suppressing these; the relevant modifier is q, which when added to the command gives lfq. If the user wishes to see the **IX mode (file protection) bits, and also information about multiple generations, the modifiers m (show mode bits) and g (show generation information) can be added, giving the command lfqmg. If the user also wishes to see an attached archive comment, the modifier A (for archive) will serve. Thus the command lfqmgA will give a fast columnized listing of the archive, suppressing any header and trailer, showing mode bits and generation information, and showing any comment attached to the archive as a whole. If in addition individual comments attached to files are also needed, simply append the c modifier to the command, making it lfqmgAc. The above command will not show any deleted files, however; to see them, use the d modifier, making the command lfqmgAcd (or double it as in lfqmgAcdd if only the deleted files are to be listed). And if the user also wishes to see the CRC value for each file being listed, the modifier C will do this, as in the command lfqmgAcdC, which gives a fast columnized listing of all files, including deleted files, showing any archive comment and file comments, and file protection codes and generation information, as well as the CRC value of each file.

Note that the above command lfqmgAcdC could also be abbreviated to VfqmgdC because the command V is shorthand for lcA (archive listing with all comments shown). Similarly the command v is shorthand for lA (archive listing with archive

comment shown). Both V and v can be used as modifiers to any of the other archive listing commands.

Generations

By default, zoo assumes that only the latest generation of a specified file is needed. If generations other than the latest one need to be selected, this may be done by specifying them in the filename. For example, the name stdio.h would normally refer to the latest generation of the file stdio.h stored in a zoo archive. To get an archive listing showing all generations of stdio.h in the archive, the specification stdio.h:* could be used (enclosed in single quotes if necessary to protect the wildcard character * from the shell). Also, stdio.h:0 selects only the latest generation of stdio.h, while stdio.h:^0 selects all generations except the latest one. The : character here separates the filename from the generation number, and the character * is a wildcard that matches all possible generations. For convenience, the generation itself may be left out, so that the name stdio.h: (with the : but without a generation number or a wildcard) matches all generations exactly as stdio.h:* does.

If a generation is specified but no filename is present, as in :5, :*, or just :, all filenames of the specified generation will be selected. Thus :5 selects generation 5 of each file, and :* and : select all generations of all files.

It is important to note that zoo's idea of the latest generation of a file is not based upon searching the entire archive. Instead, whenever zoo adds a file to an archive, it is marked as being the latest generation. Thus, if the latest generation of a file is deleted, then no generation of that file is considered the latest any more. This can be surprising to the user. For example, if an archive already contains the file stdio.h:5 and a new copy is added, appearing in the archive listing as stdio.h:6, and then stdio.h:6 is deleted, the remaining copy stdio.h:5 will no longer be considered to be the latest generation, and the file stdio.h:5, even if undeleted, will no longer appear in an archive listing unless generation 5 (or every generation) is specifically requested. This behavior will likely be improved in future releases of zoo.

FILES
xXXXXXX - temporary file used during packing
archive_name.bak - backup of archive

compress(1), fiz(1)

BUGS
When files are being added to an archive on a non-MS-DOS system, it is possible for zoo to fail to detect a full disk and hence create an invalid archive. This bug will be fixed in a future release.

Files with generation counts that wrap around from 65535 to 1 are not currently handled correctly. If a file's generation count reaches a value close to 65535, it should be manually set back down to a low number. This may be easily done with a command such as gc-65000, which subtracts 65000 from the generation count of each specified file. This problem will be fixed in a future release.

Although zoo on **IX systems preserves the lowest nine mode bits of regular files, it does not currently do the same for directories.

Currently zoo's handling of the characters : and ; in filenames is not robust, because it interprets these to separate a filename from a generation number. A quoting mechanism will eventually be implemented.

Standard input cannot be archived nor can a created archive be sent to standard output. Spurious error messages may appear if the filename of an archive is too long.

Since zoo never archives any file with the same name as the archive or its backup (regardless of any path prefixes), care should be taken to make sure that a file to be archived does not coincidentally have the same name as the archive it is being added to. It usually suffices to make sure that no file being archived is itself a zoo archive. (Previous versions of zoo sometimes tried to add an archive to itself. This bug now seems to be fixed.)

Only regular files are archived; devices and empty directories are not. Support for archiving empty directories and for preserving directory attributes is planned for the near future.

Early versions of MS-DOS have a bug that prevents "." from referring to the root directory; this leads to anomalous results if the extraction of paths beginning with a dot is attempted.

VAX/VMS destroys case information unless arguments are enclosed in double quotes. For this reason if a command given to zoo on a VAX/VMS system includes any uppercase characters, it must be enclosed in double quotes. Under VAX/VMS, zoo does not currently restore file timestamps; this will be fixed as soon as I figure out RMS extended attribute blocks, or DEC supplies a utime() function, whichever occurs first. Other VMS bugs, related to file struc-

tures, can often be overcome by using the program bilf.c that is supplied with zoo.

It is not currently possible to create a zoo archive containing all zoo archives that do not contain themselves.

DIAGNOSTICS

Error messages are intended to be self-explanatory and are divided into three categories. WARNINGS are intended to inform the user of an unusual situation, such as a CRC error during extraction, or -freshening of an archive containing a file newer than one specified on the command line. ERRORS are fatal to one file, but execution continues with the next file if any. FATAL errors cause execution to be aborted. The occurrence of any of these causes an exit status of 1. Normal termination without any errors gives an exit status of 0. (Under VAX/VMS, however, to avoid an annoying message, zoo always exits with an error code of 1.)

COMPATIBILITY

All versions of zoo on all systems are required to create archives that can be extracted and listed with all versions of zoo on all systems, regardless of filename and directory syntax or archive structure; furthermore, any version of zoo must be able to fully manipulate all archives created by all lower-numbered versions of zoo on all systems. So far as I can tell, this upward compatibility (all manipulations) and downward compatiblity (ability to extract and list) is maintained by zoo versions up to 2.01. Version 2.1 adds the incompatibility that if high-performance compression is used, earlier versions cannot extract files compressed with version 2.1. This is the only incompatibility that is permissible. You are forbidden, with the force of copyright law, to create from the zoo source code any derivative work that violates this compatibility goal, whether knowingly or through negligence. If any violation of this compatibility goal is observed, this should be considered a serious problem and reported to me.

CHANGES

Here is a list of changes occurring from version 1.50 to version 2.01. In parentheses is given the version in which each change occurred.

- (1.71) New modifiers to the list commands permit optional suppression of header and trailer information, inclusion of directory names in columnized listings, and fast one-column listings.

- (1.71) Timezones are handled.

- (1.71) A bug was fixed that had made it impossible to individually update comments for a file whose name did not correspond to MS-DOS format.

- (1.71) A change was made that now permits use of the shared library on the **IX PC.

- (1.71) VAX/VMS is now supported reasonably well.

- (2.00) A comment may now be attached to the archive itself.

- (2.00) The OO option allows forced overwriting of read-only files.

- (2.00) Zoo will no longer extract a file if a newer copy already exists on disk; the S option will override this.

- (2.00) File attributes are preserved for **IX systems.

- (2.00) Multiple generations of the same file are supported.

- (2.00) Zoo will now act as a compression or decompression filter on a stream of data and will use a CRC value to check the integrity of a data stream that is uncompressed.

- (2.00) A bug was fixed that caused removal of a directory link if files were moved to an archive by the superuser on a **IX system.

- (2.00) The data recovery modifier @ was greatly enhanced. Self-extracting archives created for MS-DOS systems can now be extracted by zoo on any system with help from fiz(1).

- (2.01) A bug was fixed that had caused the first generation of a file to sometimes unexpectedly show up in archive listings.

- (2.01) A bug was fixed that had caused the MS-DOS version to silently skip files that could not be extracted because of insufficient disk space.

- (2.01) A bug was fixed that had sometimes made it impossible to selectively extract a file by specifying its name, even though all files could be extracted from the archive by not specifying any filenames. This occurred when a file had been archived on a longer-filename system (e.g. AmigaDOS) and extraction was attempted on a shorter-filename system (e.g. MS-DOS).

- (2.01) A change was made that will make zoo preserve the mode (file protection) of a zoo archive when it is

packed. This is effective only if zoo is compiled to preserve and restore file attributes. Currently this is so only for **IX systems.

- (2.01) A bug was fixed that had caused an update of an archive to not always add all newer files.

- (2.01) Blanks around equal signs in commands given to "make" were removed from the mk* scripts for better compatiblity with more **IX implementations including Sun's.

- (2.1) Compression is now greatly improved if the "h" option is used.

- (2.1) The default behavior is to preserve full path-names during extraction.

- (2.1) On some systems, extraction of files using the older (default) compression method is greatly speeded up.

- (2.1) Extended multiscreen help is available.

- (2.1) Memory allocation is improved, so that the MS-DOS version will not prematurely abort when updating a large archive.

- (2.1) The VAX/VMS version preserves file timestamps during extraction.

- (2.1) The default archive-wide generation limit, when generations are enabled, is 3.

FUTURE DIRECTIONS

A revised version of zoo is in the works that will be able to write newly-created archives to standard output and will support multivolume archives. It will be upward and down-ward compatible with this version of zoo.

ACKNOWLEDGEMENTS

The zoo archiver was initially developed using Microsoft C 3.0 on a PC clone manufactured by Toshiba of Japan and almost sold by Xerox. Availability of the following systems was helpful in achieving portability: Paul Homchick's Compaq running Microport System V/AT; The Eskimo BBS somewhere in Oregon running Xenix/68000; Greg Laskin's system 'gryphon' which is an Intel 310 running Xenix/286; Ball State University's AT&T 3B2/300, UNIX PC, and VAX-11/785 (4.3BSD and VAX/VMS) systems. In addition J. Brian Waters provided feedback to help me make the code compilable on his Amiga using Manx/Aztec C. The executable version 2.0 for MS-DOS is currently compiled with Borland's Turbo C++ 1.0.

Thanks are due to the following people and many others too numerous to mention.

J. Brian Waters <jbwaters@bsu-cs.bsu.edu>, who has worked diligently to port zoo to AmigaDOS, created Amiga-specific code, and continues keeping it updated.

Paul Homchick <rutgers!cgh!paul>, who provided numerous detailed reports about some nasty bugs.

Bill Davidsen <davidsen@crdos1.crd.ge.com>, who provided numerous improvements to this manual, contributed multiscreen help, and provided many useful bug reports, bug fixes, code improvements, and suggestions.

Mark Alexander <amdahl!drivax!alexande>, who provided me with some bug fixes.

Haruhiko Okumura, who wrote the ar archiver and some excellent compression code, which I adapted for use in zoo.

Randal L. Barnes <rlb@skyler.mavd.honeywell.com>, who (with Randy Magnuson) wrote the code to support the preservation of file timestamps under VAX/VMS.

Raymond D. Gardner, who contributed replacement uncompression code that on some systems is twice as fast as the original.

Greg Yachuk and Andre Van Dalen, who independently modified MS-DOS zoo to support multivolume archives. (This support is not yet in this official release.)

I think the original pc-ditto can only handle MS-DOS 3.2/3.3. 5.0 may give it seizures.

Hey! Don't forget us australians!

Like, I run a BBS, and have for quite a while... I use LHarc as my default archiver, simply because J Random Luser probably has a 1/2 meg st with a single-sided floppy drive. But if you riffle through my filebase, you suddenly find that all of the larger packages, ones that require a real machine, also require a real archiver to unpack. I feel much more comfortable, from _long_ experience, with zoo than I ever will with LHarc. It's atually possible with zoo to recover parts of a damaged archive, which can be a real plus when you've just downloaded this monster archive from the other side of the word on a whim... With LHarc, one broken byte, and it's history... with zoo, well, you extract what you can, mug it with FiZ, get the rest, and drop the sysop there a nasty little message about his local phone company...

Needless to say I fail to give a damn about speed - they both run at comparable rates on the TT.

Roger - face it. You need some Valium. Probably lots. Sit down and let the 'ol ticker relax for a while.

Bill - why not ignore him?? 8) (btw I can't get that nroff of yours to compile with anything... 8(HSC 1.33i and gcc1.40/mintlib pl20 are both bogi... HSC bombs while compiling (automatic arrays initialised inside functions??) and gcc produces an unusable binary.) Seeing as it's not available as a binary distribution, how about a gcc-able version??)

345. Help on using ZOO - THANKS!

Newsgroup: comp.sys.atari.st
Date: 1992-07-10 08:35:26 UTC
From: otv@hal.nta.no
Message-ID: <1992Jul10.083526.26214@nntp.nta.no>
Source record: 219953

This article is to thank all of you who e-mailed me whith useful hints on using archivers!!! Now everything is working fine. The reason why "x <filename.zoo>" as parameter input from desktop did not work with zoo21.ttp was probably one of the following:

1. The archive to be depacked was not in the same directory as zoo21.ttp, or

2. I used a X instead of x

I also got lots of other useful information - maybe some of it should be put in the next FAQ (The FAQ's was great for me as a novice).

Thanks again,

Oddvar

346. New ST Format - c/w STOS....

Just letting you folks know that the new ST Format
is out and is bundled with a free copy of STOS basic. Also
included in the Animaster v3.4 sprite editor. Not bad for
3.95! Of course there isn't a full manual that will cost an
extra 11 sheets! Also includes cheap offers for the rest of
the STOS programs.

Personally I probably wont use it, but it's a nice
thing to have in my Disk Box :-)

C.W.

P.S. It also includes a fairly good review of ST Monitors!

>
>So, what's improved/changed/fixed in this new version?

First, in the files on a.a., the pscript.hdr file is in modules.arc - it should be moved to the printers folder if you're using the postscript driver.

2.2 improves on the user interface and introduces some minor changes to the toolbox, and adds some shortcuts (shift + click on toolbox icon).

The macro processor is fixed.

Lots of new printers and import/export modules (Calamus Vector Graphics, Calamus text, That's Write, Calligrapher), improved modules (ASCII, EPS, Adobe Illustrator, GEM).

Big improvements to the PostScript printer driver.

PageStream is now stable on 1MB machines and will let the user recover from low memory situations.

When typing over highlighted text the first character is now redrawn.

More efficient screen redraws are employed for Move to Page, Set Grid, Show Pictures and Create Columns.

The Fonts/Points dialog box opens more quickly.

And lots more changes that you won't immediately see, but will probably appreciate.

> than you, now would you? :-)

Irrelevant.

> 3) more "prestigious" groups (eg comp.sources.unix) use shar also
> and do not allow binaries (except when essential to the post).
> the archive sites preserve the shar files by compressing them
> or creating tar files and compressing them. same for GNU.

Shar files are inconvenient. Compressed tar files are great. Generally, any compressed format that yields an immediately usable document after uncompressing is preferred. Different archive sites do different things, but most sites that archive usenet postings just preserve the actual articles themselves. On atari.archive, I tried to fully extract all the postings and then repackage them with arc or zoo or whatever, because it saved space and was more useful afterward. Unfortunately, I never got a satisfactory script going to automate this procedure and it required too much attention to deal with by hand all the time. So it goes.

> 4) comp.sources.atari.st used to use shar. what happened?

Dunno. Shar files are definitely nice for usenet postings since you can browse thru the posting and it'll make sense. But they're definitely not desirable for archival format...

I know 2 possibilities: Either there is GDOS (use vq_gdos();), then
you can use the GEM-Fontload-commands. If there is no GDOS installed,
you have to generate your own GEM-Font-header for the aes to use.

Greetings Roland

From: saj@chinet.chi.il.us
Message-ID: <1992Jul10.140244.7629@chinet.chi.il.us>
Source record: 219966

The main features that the Pagestream update to 2.2 adds (from my perspective: I mostly do things like flyers and forms) are greatly improved screen redraw speed, more rational font handling and more direct access to the screen magnification features. There are also the new graphics and printer drivers (Deskjet 500C is said to work now), and the macro handling bugs are said to be fixed. I think there may be a new bug in screen display under some conditions, but a nasty bug in printing to devices with non-square pixels is said to be fixed.

The improved working speed matters most to me, and it's a worthwhile upgrade.

Make sure you are trying to use PCDitto version 3.0 as it was the only version (to my knowledge) that supported the mono monitor.

Otherwise, perhaps it doesn't like DOS 5.0. Try an earlier version, say 3.x something and see what happens.

When you execute PCDitto itself, you should get a copyright screen with a prompt asking you to insert a DOS disk and press Return. If you haven't got this far, then I'd suspect your copy of PCDitto software is bad. Try it on someone else's machine, if possible. Unfortunately, Bill Teal and Avant Garde are not in business anymore so there is no support for PCDitto.

358. ST Format Fire and Ice demo difficulty

Newsgroup: comp.sys.atari.st
Date: 1992-07-10 14:16:01 UTC
From: rrk@vixen.uucp
Message-ID: <1992Jul10.141601.10158@porthos.cc.bellcore.com>
Source record: 219965

I just purchased (July 10) two copies of the July issue of ST Format (which is when I can get it here in New Jersey, USA) - the issue featuring the Kuma spreadsheet. On the accompanying disk is a demo for the Bitmap Brothers "Fire and Ice." I can't get it to run. I tried giving it its own disk, and I tried both of the individual copies I bought - all I get is a dark screen on a 1 meg STfm and a dark screen with an upper band of blue on a 2 meg STe. The spreadsheet runs fine, but hasn't as much action as I was hoping Fire and Ice would provide.

Is this a problem common to all July ST Format issues, or uniquely mine, all mine? Did I miss a critical instruction? I looked for booting instructions - they were rather spare. Any help appreciated.

Randy Kutz rrk@vixen.cc.bellcore.com

P.S. Thanks incidentally for the responses on shareware fees to UK et al. I think I will try the dollars option with extra padding for conversion on arrival.

ATARI says to its technicians:

HDX 5.0 is neither able to format nor to partition neither a SH204/5 nor a
MEGAFILE 20/30/60. you have to use HDX3.02.
But you may install AHDI 5.0 it works.

Every version of PC Ditto (with the possible exception of the very LAST release) will not work with a monochrome monitor. I'm personally unsure whether the last version worked with a monochrome monitor, since I don't have one anymore. You will need to find a color monitor to use PC Ditto.

>Yes try it with the DOS they recomment PC DOS 3.3 , it you don't intend
>to boot from the Hard Disk then MSDOS 3.3 will be ok...

MS DOS 5.0 works quite nicely with PC Ditto. Don't expect to be able to use the "goodies" like the new editor or the DOS Shell program. They are simply too slow (and, in the case of the editor, too confusing) under the emulator.

I, too, had a problem getting the "Fire and Ice" demo to run on a Mega 4 ST (TOS 1.4) with much the same symptoms. Either the demo requires an STe (my suspicions, given the behavior of the opening screen), or the demo file was corrupted on at least two individual magazines.

The problems is with the frequency your monitor is running at. This demo of Fire and Ice, and the one on the ST Action magazine both require the system to be running at 50Hz. The best way to do this is to get a copy of DC Bootit, which is a great little utility for changing frequencies and boot devices.

366. Can't link using gcc and gnumake

Newsgroup: comp.sys.atari.st
Date: 1992-07-10 19:15:32 UTC
From: mistik@grex.ann-arbor.mi.us
Message-ID: <Br6tHy.HG8@grex.ann-arbor.mi.us>
Source record: 219861
Cross-posted to: gnu.misc.discuss,gnu.gcc.help,comp.sys.atari.st,comp.sys.atari.st.tech,alt.test

Hi GNU netters,

I recently got GNU gcc and gnumake from terminator.cc.umich.edu. The latest version of gnumake (3.62) seems not to work, it always complains about not enough memory, although it has about 3 MB available (I use a Mega ST4). However, I was able to get the previous version (3.60) to work. I use tcsh in unixmode to work with.

When I say I got gnumake 3.60 to work, it is not completely accurate. I don't know where the problem lies, but I wasn't able to make the programs invoke gcc-ld instead of ld. When gas tries to invoke ld, it does not find it, and it stops. All the other compiler programs work but not the linking part of it. I don't think renaming gcc-ld to ld would be the right solution.

Another problem I have found is, that the binary archive for the libraries do not include crt0.o and gcrt0.o, you have to get the sources additionaly to make them.

How should I go about letting the gnu assembler know that the linker is called gcc-ld? (I tried to define LD and LINKER in environment, and in makefile leading to no solution.)

Thanks for any help in advance.

I use PC-Ditto semi-regularly to run Microsoft Word 5.0, and I ALWAYS run it
on the monochrome monitor. No one told my it shouldn't work, so I just did
it. (Now that I know better it'll probably stop working.) I have run it
with MS-DOS 3.2 and 5.0 with equal success, usually launching from PathMinder
4.00. I fired up PC-Ditto once on the color monitor and didn't much like
what I saw so never tried again. Please tell my why it won't work so I can
pass that information along to my obviously ignorant 520ST.

See the line you quoted above, which I wrote? Read the words between the parentheses. Note that I said there was a possible exception. I wrote it that way because (a) I don't have a monochrome monitor and can't check; (b) the folks who put together PC-Ditto are long out of business, so there are no newer releases.

Congratulations. You obviously have the last release of PC-Ditto. You would have been out of luck if you had an earlier version.

Next time READ first, then post your "obviously ignorant 520ST" questions.

The 'new' directory is writable, but not readable. You can get files from the directory IF you know the name (like mntemacs.zoo), but you cannot do a regular directory listing. They'll get moved to the 'newitems' directory when Jeff gets down to the University of Michigan campus next.

>I have days when I contemplate jumping ship myself...but who would I sell
>my Atari to?

Because of the relatively low cost of most Atari ST computers, I would urge anyone considering moving to another platform to seriously consider donating their ST to a teacher in your community.

There is PD/Shareware software available for a teacher to

1. Prepare lesson plans
2. Keep a gradebook
3. Write up tests
4. Generate scientific plots and graphs

Many teachers don't own a computer, either because they cost so much (which was the case with the Apple // series of computers which many schools use), or because they don't have any idea how useful they might be.

The Atari ST is a perfect computer for many teachers because of its graphical interface and the IBM disk-format compatibility.

You're going to spend $1600-$2500 on a new computer platform. Your initial investment in an Atari ST could have been as low as 1/4 that amount, and the current value of a used Atari ST is more like 1/8 to 1/16 that amount. You're not going to recoup a lot from selling the ST ... consider donating it to one of the teachers in your community.

-- David Paschall-Zimbel

Note: Hard disk drives and commercial software are another thing entirely. You can always find someone to purchase a hard drive or a commercial program by placing a notice in misc.forsale.computers or, say, GEnie or CompuServe --- or contact your local user group.

The problem with that is that I believe my version of PC-Ditto to be a rather old one. I purshased this 1985 vintage 520ST for my father-in-law back around '87 third hand, and this copy of PC-Ditto came with it. By the time my father-in-law gave it back to me a couple of years later he'd lost all the documentation (he never used it). I assume that the boot screens I never look at would tell me the version, so I can check this weekend. Does anyone know which version is the one that's supposed to work okay? I'm still fumbling around in the ST world after only recently making the jump from the 8-bit (and still having one foot back there).

But I DO regularly use PC-Ditto, and always in monochrome.

It would be more understandale if you turned off erro correction,
though if the modem expected flow control to work and it didn't who
know what would result. <Maybe the modems using error correction protocals
need to use rts/cts. anyone know?>

That isn't
>really important, though, since my original question was whether or not
>it was possible to make the ST take data at 38,400 baud since I am
>planning on purchasing a 14.4K modem

Michel, despite what it says on the boxes and in the advertising
blurbs, I don't think any of the current crop of 19200 modems ever
even get near 19200 on 90% of the transfers over normal phone lines.
Only under really optimal conditions are the compression functions
going to achieve their claimed compression, and if, like most people,
you mainly transfer compressed binaries, they're useless anyway. MNP5
will actually slow your trnsfer down, and v42 is just smart emough to
know enough to leave it alone if it's already compressed, so it also
uses cycles checking that.
For screen updates on login sessions, usually the updates are
quite reasonable(faster than you can read), so basically trying to go
faster is not really possible, at least in my experience connecting
with many different machine/modem combinations.

377. ShadowTerm II -- Available (c.b.a.st, c.s.a.st)

Newsgroup: comp.sys.atari.st
Date: 1992-07-11 03:08:27 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <s99PNB5w164w@ersys.edmonton.ab.ca>
Source record: 219991

ShadowTerm II has been released and sent to comp.binaries.atari.st and atari.archive.umich.edu. The file should appear soon as SHDWTERM.ZOO!

Here is a description of ShadowTerm II. It is Shareware. More information about that can be found inside the ZOO file, rather than here, since this is not a forum for advertising.

Description

Over the last several years, there have been many Shareware and public domain terminal programs available for the Atari ST series of computers. They all claimed to meet the special needs of the user. Some of them were able to come through on this claim, but most fell short in several key areas, such as:

a) the user interface

Do you hate muddled, non-standard user interfaces? I do. ShadowTerm II provides a crisp, clean, and direct menu-driven user interface. Each command *ALSO* has an easy-to-remember keystroke equivalent so that the expert user can move through the program with ease and speed. ShadowTerm II runs in medium AND high resolution.

b) program functionality

Some programs do one thing extremely well, and completely neglect other important functions. ShadowTerm II does nearly everything you could ever want! It has a host of disk functions, an exceptional dialing interface, a wide range of terminal mode commands not found in any other terminal program, a comprehensive viewing buffer, a great file transfer front-end, a facility that will allow you to have your computer perform logon sequences for you, and even a special interface that allows you to run up to ten programs with a single keystroke! That is only half of what ShadowTerm II can do for you!

c) ability to do what it claims to do

They say that humility is good for the soul. I'm not so sure about that, but I am sure that there are certain programming feats that I am simply not able to perform. While developing ShadowTerm II, I had to make a hard choice; do it all myself, or make use of available facilities. Since I wanted ShadowTerm II to perform all functions as well as possible, I decided to follow the latter method. That is why ShadowTerm II uses the excellent

XYZ external transfer protocol written by Alan Hamilton of
Starfall Software and the superb Ymodem-G external transfer
protocol from Zipline software.

ShadowTerm II does all the work of calling XYZ and Ymodem-G
All you have to do is choose a transfer protocol and then choose
the file(s) using the file selector.

Please note that this demo is FULLY FUNCTIONAL. There is a thirty
(30) minute time limit that starts counting the first time you enter
Terminal mode.

378. High speed modem connection

Newsgroup: comp.sys.atari.st
Date: 1992-07-11 03:31:41 UTC
From: lombardo@odin.unomaha.edu
Message-ID: <lombardo.710825501@odin>
Source record: 219987

Well, after people assuring me that I needed a rs232 serialfix program, I finally found one, but it says it is for Tos versions 1.4 and up! I have 1.0, and users told me I definitely needed a fix program. I have turbocts.... which program on a.a is specifically for 1.0?

Anyway, now that I have a 14.4k modem, I tried calling a couple of long distance bbs's. I connected at 14.4k/ARQ to the Thieve's Guild BBS and was amazed that I was actually connected at 14.4! I tried uploading a file using Ymodem G and got a blazing 3000 cps on the first 50 or so blocks of the upload! BUT, then the modem just sat there as if it was waiting for some sort of miracle to happen! Nothing happened for about 5 seconds, and then the modem started transfering again! It went on like this and finally completed the upload at a slow 1200 cps... (well, compared to the 3000 it was doing to begin with!) Each block was sent at about 2500-3100 cps, but that annoying pause about every 50 blocks sent the average cps WAY down.

The sad part is, the upload was never completed! At the end of the transfer using zmodem (which got the same annoying pauses!) my xyz.ttp program said 100% of the file was transfered, and again just sat there. No, it didn't want to send an EOF or anything, it just wanted to sit there. So, I waited patiently, and it finally returned to the terminal mode, where it sat for a little while, and finally reported "Upload aborted, try again?" give me a break! I just spent 20 minutes of useless time long distance! What is the problem here?

Thieve's Guild is a Turbo board (well, can we really call it "turbo"?) and it IS a registered version of the software. Is this a fault of long distance lines? I doubt it. They would slow the cps down throughout the transfer, not just in little 5 second pauses... Is it my modem? I really doubt it, since I can connect to other 14.4 boards in my area and not duplicate the problems... (although I have never gotten 3000cps on even a local board at 14.4k/arq)

Why am I getting these pauses? Why can't I get 3000+ cps on other 14.4 boards? Why wasn't the upload completed in the first place?

From: wmagro@uiuc.edu
Message-ID: <Br7GIt.LBw@news.cso.uiuc.edu>
Source record: 219985

Under MiNt I recently did a:

```
tar cf - * | ( cd e:\;tar xvf - )
```

and then sent the files back to c:. This little activity was performed in order to defragment drive c:. I noticed that the writes become slower and slower as the once empty partition fills up. I have been told that 'fatspeed' fixes this, though I have been unable to get it to work.

I got the latest version of fatspeed I could find, and the docs say that it works on ALL tos'es up to 1.4 or so. I have a nov 11 1985 TOS 1.0. When I run fatspeed, even off of a bare boot disk, it reports that it can't install.

Does anyone know what the problem is? Is there another utility I can use? Untarring 1000 *.tfm files really chews up time with slow fat lookups. Help!

Thanks in advance,

Bill

380. copy rights?

Does anyone know what the official copyright status is of programs like PC Ditto, once their copyright holder dissolves and discontinues the product.

Are we allowed to snap up copies from our friends and neighbors, or are the copyrights still valid, so that we can only legitimately obtain the program by purchasing a used original?

Just curious. Flame me for asking an honest question, and I will call you a fool.

> when they're obsolete" Computer. Did you really expect them to get on the ball
> at this late date?

Far be it from me to be an Atari apologist (in general), but in this case
Atari is not at fault:

Atari certainly did not announce the Falcon 6 months ago. Indeed, it's
somewhat arguable that they've "announced" the Falcon yet at all; they've
shown it to certain groups of developers, but I've never heard an official
Atari announcement of the Falcon aimed at the general public and giving
any specifications for it.

What I *have* heard are lots of unsubstantiated rumors (here and elsewhere)
and all sorts of claims about the Falcon from people *outside* Atari. It's
hardly fair to blame Atari for other people's rumor-mongering, though.
For once, I think Atari has got the right idea; they're going to build
the machines, and *then* they're going to announce them. Hence the silence
from Sunnyvale.

Source record: 219989

In a previous article, gfarrell@fraser.sfu.ca (Gordon James Farrell) says:

>I've had some trouble with bombs in Wordflair II,
>but I'm not sure yet who to blame: FSMGDOS, TOS 3.01 (slightly incompatible),
>or Wordflair II. On the whole, I'm quite happy with it.

I've had bomb problems too. With TOS 1.06. The program seems
to want somewhere between 2 and 3 megs of RAM, so I have to run it on
a clean system. If run from Gemini, it only takes 800K, but WON'T PRINT.
I suspect (although the problems seem to be unduplicatable!) that it's
memory related. Maybe FSM bombs if you run out of memory. Even with
the clean setup I have, I can only edit a little and run a few copies
before it bombs and I have to reboot.

The bombs happen 95% of the time in the print function, after about
20 seconds.

It is impossible to list the files themselves that are located in the atari/new/ directory on atari.archive. the only way you can get files from there, is by knowing the exact filename, and typing

get [filename]

in the usual way. Otherwise, you have to wait until the 'Sysop' updates the new files list, and seeing as he very rarely gets to access the computer system at the moment, this may take a while - in another couple of months, it should return to it's usual high-standard! (As well as a HUGE new files list, as it hasn't been properly updated in quite some time!)

I'm not really sure what you mean. What would make for "optimal
conditions"? A lack of line noise? I have never had problems with line
noise before, so it must be safe to assume that the lines are at least
good enough in that regard. What else makes for better conditions?

Also, shouldn't a true 14,400 modem go at least that fast, so long as
there are no errors? What kind of speeds should I be expecting?

p>How can I force a program to use a different font set than the original one?
p>And in what kind of format are the fonts stored in memory?

The program has to be capable of using GDOS and GDOS-fonts. Then you can choose. If you want the system font to be replaced, you must (still) take a whole vdi driver like those delivered with NVDI.

>Any ideas?

I had the same trouble. Apparently PC Ditto 1.0 does not like MS-DOS 5.0. I switched to dos 4.01, and have had no problems since. However, I never did get PC-DITTO to access my hard drive. Perhaps someone's figured that out? The manual was not exactly helpful.

...But it's not too important. The last thing I want is MS-DOS trashing the directory of my hard drive. GEMDOS is quite capable of doing that all by itself...

I have never had any problem with zoo at all. I have several version but
prefer to use the zoo_boy shell as it seems to work well. I also use the
archiver shell for zoo on Windows 3.1 and it works equally as well. Maybe
Roger got a bad copy or his shell (if he uses one) is not set up for the ttp
he is using.

393. Another ST Format disk prog. problem!!!

Newsgroup: comp.sys.atari.st
Date: 1992-07-11 18:15:17 UTC
From: richardson@vaxr.sscl.uwo.ca
Message-ID: <1992Jul11.141517.1@vaxr.sscl.uwo.ca>
Source record: 219995

Perhaps I can get some feedback from netland on another ST Format cover disk problem. On 2 recent cover disks a game (PENGUINS) and database (SUPER CARD 2) were included. Both were compressed and use some sort of self extracting process to first format and then write auto-bootable disks of these programs. The problem is I can't get either to extract, or whatever they do! STF said you simply need a blank formatted disk, but the program asks for a 'new' disk! I suppose this is irrelevant since it's supposed to format the disk anyway!!! I tried running both programs and I get the format warning, proceed and the display goes funny. This is supposed to happen though. The format starts at track 80 and proceeds backwards. When I run it though it gets to track 79 or 78 (77 once) then tells me the disk is write prtected!!!!!!! NOT! I've tried variety of disks formatted various ways and NOTHING works. I have a 520STm (@1985, TOS 1.0) upgraded to 2.5 megs. The only thin I could think is that the funny disply means the program accesses video ram, at the top of memory, and my upgrade is causing the program to screw up...any other suggestions!

If anyone got these to work, and they're any good, I wouldn't mind getting hold of them! As usual thanks in advance for any help,
T.T.F.N.
JR.

I am using a CGA monitor with my atari ST. As far as I know the
SC1224 is similar in design. VGA uses a totally different approach.
Sorry, but it will probably not work.

Julian, you are right but I have to disagree with you. There are some very
nice packages for the Atari ST which are sold separately. However, WordPerfect
for the Atari ST (v 4.1) can not be compared to the PC version. It's just day
and night. The version is slow, crash prone and has never been updated. The
PC version has always been updated, and the Windows/OS 2.0 versions are very
nice and reliable. I am not certain if there ever be an updated ST version,
since WordPerfect corporation has stated that the most important market for
them is currently the OS/2 corporate market.

I am certain that if WordPerfect would release an ST version which would be
the equivalent to the PC, it would certainly be a major advantage for both,
the ST users and the company itself. I haven't found any ST package that
are as powerful as the PC WordPerfect package. Some do to a certain degree
but they still lack many features.
If the ST packages suits a person's need it's fine though. Let's hope that
the support for ST packages continues...

PS: What software did you use for producing 'ST-STE-TT Profibuch'? Which
for schematics?

>something slows down the comp...
>
>bye

i thought i did. Must be something else. What if it's coming in so fast
that it doesn't even reliably get to the buffers. i presume there is some
kind of interrupt to service the buffers. i presume if it can't respond
quick enough to grab the data from the USART and shove it into memory then
you'll get overun errors.

i'm not familiar with the modern chips for serial ports. My recollections
of ACIA's are that they don't do much buffering and will spit out an over-
run error if the buffer is full and has not been serviced. (i.e read)

You are right the handshaking must be breaking down somewhere. i had set my
host to zmodem streaming (i.e 0 window size). My guess is that this is a
little flakey in terms of handshaking (it doesn't renegotiate block sizes
at all for a start !). i have noticed that on very big flushes to disk
when there are longish pauses that there will often be some repositioning
errors/sub-packets too long, so there is obviously a difference of opinion.
This is at a DTE of 19200 so at double that it must blow a hole in the
handshaking somehow.

Adam.

397. Game Workbench

Okay, here's a few questions: Has the GW been released yet? If so, where can I get it? How much? If not, when? Why not? Which versions of Sozobon will it work with (will it work with other compilers?)

I could seriously use the GW Real Soon Now.

- Mark Hughes mhughes@visual.spk.wa.us

>
>Also, shouldn't a true 14,400 modem go at least that fast, so long as
>there are no errors? What kind of speeds should I be expecting?

Actually, a true 14400 will go even faster. ;-) As to speed to
expect, I see actual speeds around 1550-1650 cps, using a USR dual
standard. As to noise on phone lines, you may not have noticed much at
2400, or by voice, but once and a while on my unix dial-up, one of the
older modems doesn't set error correction, and you should see the garbage
spew out.
I don't know what the limitations are, but no one I know has ever
gotten a real 19200 out of any current 14400 on the Atari, so worrying
about hacking up to 38k is silly(IMHO)

My advice is to just install the new serial fix program, (the one
Eric Rosenquist says _really_ works), and a serial buffer expander (works
sort of like a hd cache). Depending on what modem you get, check out the
various setting files people have uploaded to various bbs's, and unless
you're getting rediculously low rates compared to everyone else, don't
worry about it.

I asked a freind to hook his HST up to his TT port that can do >19200,
if he reports a speed improvement, I'll let you know.
Also, many programs use processor dependant loops to calculate speed
when doing transfers. With my Adspeed on, several zmodem programs were
reporting 2000+ cps. Flip the Adspeed off, and down it went.

p.s. Eric R, please e-mail if you read this, my last mail bounced.

Okay, some questions:

1. Was there ever an STE version of Protracker 1.2 (or higher) released?

2. Does anyone know what happened to the 16-voice tracker?

3. Is there any way of getting the .MOD files from within the An-Cool
M Demo 3, or can I get them from somewhere.

And, does anyone know a good FTP site with a decent assortment of .CPX files?

From: kawakami@ocf.berkeley.edu
Message-ID: <44490@ucbvax.BERKELEY.EDU>
Source record: 220000

Has atari changed its "developer" policy yet? They keep bringing out hardware that is really pretty hot, for what it costs, and then leave it up to people who want to pay $300 to be in-with-the-in-crowd, random geniuses like Dave Small, and demo-club-teens to exploit the hardware.

It's ridiculous. The Amiga is holding its own in the desktop video field, the Mac is making inroads, and the PC is trying to get started. The Amiga uses a "standard" zorro bus which we can get specs for, the PC is generic and there is a book on how to make cards and write drivers for the Macs. Can we get timing diagrams, API specs, etc for the new Falcon?

C.S.A.st is proof positive that its far better to have lots of information, and have a little bad information, than to have little information and less bad information.

GW has not been released yet. The system is finished and has been through substantial beta-testing, but the documentation is still being written. (GW is a *big* system and excellent documentation is therefore extremely important.) You will be able to obtain it through the usual channels as of mid-September if all goes well. Double Click is distributing it, hence they'll set the prices; I don't know what the current ideas are w.r.t pricing so you should probably contact them directly for that info.

GW will work with all versions of Sozobon; in fact the system itself was developed with Sozobon. Versions also exist for GCC, Mark Williams C, and Lattice C. Laser C support exists but I don't recommend anyone using Laser C for serious development since the environment has serious bugs. I personally favor Sozobon and GCC as I've had major headaches with all the commercial compilers. GCC in particular seems to compile just about anything properly given correct paramter tuning. :)

> I could seriously use the GW Real Soon Now.

I'm glad to hear it and I'm confident it will meet your needs. No one is more eager to see the product out there than Neil (Forsyth) and me!

BTW, it's just "GW," not "the GW." We decided to drop the "the."

No problem. Once the 1.4 version is tested and debugged, source will
be distrubuted (unlike v1.33). I warn y'all now though: some of it is
Not Pretty. ::grin::

In the next linker (after 1.4), I'll up the external name limit from
7 to 22 (or maybe 36) chars, and that'll be a big enough change to require
basically rewriting the linker, so I'll remove all that silly object
table stuff, and then there won't be any limits (other than available
memory).

(PS, you're better off posting Sozobon/HSC-related stuff in
comp.sys.atari.st.tech instead of here. This newgroup is so noisy I
often just skip all the new messages.)

> discontinues the product.

This was discussed extensively in the law conference on BIX. The legal minds there were in concensus on the fact that a copyright does not cease to exist when the owner of the copyright goes out of business or dies. So in a legal sense, it is still a crime to make copies even after the company goes out of business.

On the other hand, if the company is gone, who's gonna prosecute you? I guess you'll have to let your own moral standards apply. (But consider: an out-of-biz company could still license the product to another firm at a later date. But, if widespread illegal copying has occurred, chances are it would be prevented from doing that...who'd buy a copy at that point?)

Hmmm... Well, ya got me there. Doesn't make any sense to me at all.

>it was possible to make the ST take data at 38,400 baud since I am
>planning on purchasing a 14.4K modem and the fastest speed the ST can now
>receive data at is 19.2K. Since the modem compresses text as it receives
>it, it is fairly likely that the throughput might exceed 19,200 baud (in
>which case I am losing valuable speed.)

I am interested in this as well, although the notion that my machine would
be LOCKED at 38,400 isn't acceptable to me. I often times use my ST
to connect to another machine that runs at a maximum of 9600, so I'd need
to be able to set the system back down.

For what it's worth, I'm using a Supra 14.4 data/FAX modem right now
and it's working out just GREAT. I wondered about it being limited by
the ST operating at a max of 19.2, but often times I'm transferring
compressed data, so I don't think it's being held back TOO much...

Sorry, but I get 19200 regularly (daily!) with my HST DS+ (V32bis
connection) on text files. Note that this is with *text* files. I
suppose it depends on whether or not you are downloading buckets of
uncompressed text (I am!). This is with a standard ST Mega4. One thing
that I *do* change is that I try to use this speed with a "clean" machine,
with no accessories or auto folder programs that aren't necessary. If I try
high speed comms with a machine crammed with installed progs, I get errors.
I didn't bother checking to see which programs were causing problems, I just
ditch the lot for comms.

The figure for compressed files *is* lower, of course. More like 16,000
or a bit less. It depends on how well the compression has been done, but
V42bis appears able to squeeze a bit more out.

> My advice is to just install the new serial fix program, (the one

Source record: 219895

It is possible to set your system at 38400 via HSPD_232.ACC or by using a hardware modification. Locking your port at 38400 would affect a connect to a 9600 baud BBS... just leave your FLOW control on, and avoid using DIRECT connects. So how do you like your fax/modem? I have one as well, and am disappointed by it's cps. I figured I would get around 2000 at least, and instead I get like 1450 - 1650. I've been told that that is good, but I dont think so...

Also, have you found any FAX software that works with the Modem? I haven't found any yet... I have heard of a program called Fastfax or something like that though that should work. It's too expensive though.

414. QuickBasic equiv?

Newsgroup: comp.sys.atari.st
Date: 1992-07-12 17:16:06 UTC
From: fnjlh1@acad3.alaska.edu
Message-ID: <12JUL92081606@acad3.alaska.edu>
Source record: 219864

I've been using QuickBasic at work and am impressed with how easy it is
to use. Is there something equivalent in the ST world? I fiddled with MWC a
little and its not for me. ST Basic seemed buggy and unsupported when I looked
at it. This seems to leave GFA Basic.... any users want to comment? Especially
those familiar with QuickBasic?
I saw an ad for GFA claiming some sort of easy conversion to the MSDOS
world (for a price, of course). Any experience with this as well?
thanks for any info

415. COPYFIX date/time patch

Newsgroup: comp.sys.atari.st
Date: 1992-07-12 18:48:26 UTC
From: dumgrunt@ccwf.cc.utexas.edu
Message-ID: <75683@ut-emx.uucp>
Source record: 219894

Does anyone have a copy of the latest version of COPYFIX? Yes, I'm _still_ running TOS 1.0, but I'd like to have the timestamp kept correctly when I do file copies. I understand that the newest version of COPYFIX finally no longer causes conflicts with other programs. It's supposed to be available from the ICD BBS, but since I don't have one of their host adapters I don't have access. (And I can't find it on a.a.u.e either.) If you've got it, please post it here or e-mail me. Thanks a lot.

I don't know about this particular issue, but this is something you have to live with when you buy British magazines. I have dozens of cover disks from UK magazines, both ST and Amiga, and I would say fully half of the games do not work on North American, NTSC machines. The assholes that produce these things do not test them at all on NTSC machines or different memory configurations. I've even seen magazine disks that put their own homebrew menu system on the disk which is pure garbage and IT doesn't work on NTSC machines even though the games might. Pathetic, and a very annoying waste of money for NTSC customers. I hope some magazines in the UK wake up soon.

417. C compilers and Resource Editors for ST

Newsgroup: comp.sys.atari.st
Date: 1992-07-12 20:17:30 UTC
From: basil@eniac.seas.upenn.edu
Message-ID: <82876@netnews.upenn.edu>
Source record: 219869

Hello! Well, I am currently stuck with the infamous Laser C with all its annoying bugs and ridiculously bad Resource editor. I'd be happy to try Sozobon or GCC if I knew what the best resource editor out there is -- ie.

are there any RCS that are nice enough to allow you to simply load graphics /icon files for creating icons, or do you have to edit them all from scratch?

Are there any that, like on other platforms, actually write the C code for you after you describe how you want the interactions?

Are there any that allow you to easily customize things like buttons (make 'em round) for creation of nifty interfaces (much like Neodesk, and Cubase have)?

Also, I have heard good things about Pure C, and know it is being released here by Gribnif (who make a nice icon editor -- wish they'd expand it for making resources). But, will the docs still be in German?

>have to buy new roms and compatibility problems are going to rampant.

Choke, choke, choke! Having the OS in ROM is the best way to PREVENT
incompatibility problems - it freezes development at a point. One
computer system with the OS loaded from a disk is plagued with
incompatibility. We have very few programs that don't work at all
under a version of our OS, while on that machine, you have to keep all
the official versions you can get your hands on - and some that have
been patched by third-parties.

I like the idea of having the OS in ROM, and using AUTO programs to apply
patches, although having a jump table in RAM for each OS routine would be
a more efficient way to link in patches (the way things work now, all
patches must chain them selves into 1 or 2 trap vectors.

>LAN, MIDI, 16 bit stereo input/output, 386 slot, superVGA, blitter,
>video overlay, 1.44 MB floopy, 4 joystick, AND $700-900 price???

Not to nit-pick or anything (I mean, heck, this is basically vapour-
ware we are talking about - except for the fact it HASN'T been _officialy_
announced), but the SCSI 2 capability has _NOT_ been reported in any of the
reviews I have seen. In fact, the only time where I have heard Falcon (or
other alias) and SCSI-2 mentioned in the same article was in one of my earlier
speculative posts on whether Atari would Make The Right Move (tm) and Do
The Smart Thing (tm) by going to SCSI-2. :)

-Mike

Ps: I still hope that they go to SCSI-2, even in the lower Falcon model - I
should think that SCSI-2 would be a staple item if they get around to doing
a high-performance (ie '040/many slots) Falcon.

>before it bombs and I have to reboot.

Have you tried to limit the amount of "font caching" memory that FSM uses? If I remember right, FSM is initially set up to hog a whole lot of memory, and by limiting the size of the font cache, it will allocate less memory. Of course, if you documents use a lot of fonts, your speed will go down (as it will then have to load/unload fonts on the fly), but if you don't use a lot of fonts (and if I remember right, the initial setup was for an outrageous number of fonts) then shrinking the font cache should help a lot.

> The bombs happen 95% of the time in the print function, after about
>20 seconds.

This is likely due to the FSMGDOS and not enough memory, as when printing (I assume to a SLM laser printer) the bit-maps take up a huge chunk o' memory. Try that resizing trick and let us know how it works out.

>to be able to set the system back down.

Why should you care if your system is LOCKED at 38,400 if your modem can handle it? Remember that the speed of the link from the computer to the modem is irrelevent to the speed at which the modem connects to another modem. You could conceivably have a 76.8k connection to your modem (if it could handle it ie: 19.2k w/.42bis) and still be able to connect to a 9600bd modem. Remember that even if you are transferring info at > 9600, the modems are still transferring info at their base-rate (with compression).

The modems deal with the computer rater >= link rate by caching the data and requesting new data once it has spit out the old data. The great thing about it is you don't have to think about it - the modem does all the finagling neccessary for getting a workable link (you just have to make sure that your link to the modem is correct - RTS/CTS, bps, right cable, etc.).

You shouldn't be (worried). Even with v42bis on, it would recognize that the data is already compressed and still send it off at 14.4k (which if you read above it does anyway). BTW, does anyone know if v42bis compression is better than say ARC? I would presume so (I have yet to see ARC do 4:1 compression) but would it necessarily be able to compress it further or would the ARC compression hamper the compression routines of V42bis? In other words, would it be faster to send unARCed files as opposed to ARCed files (I know it would be futile to do so with .LZH or .ZOO)?

Message-ID: <31027@slice.ooc.uva.nl>
Source record: 219887

Hi all,

I got apl68000.arc from a ftp site in germany.
I ussume it is the same as in atari.archive.umich.edu
The problem is that it is a demonstration version only.
I like the apl environment very much.
Much better than the j_41_st.zoo that i got from umich and
it seems pretty useless to me.
If I knew more about 68000 assembler I could path the
demonstration version.
The only thing it doesn't do is saving files aparently.
Anyone can help?
Is there a commercial version of apl68000 or a fully functional one?

please mail me at noam@ooc.uva.nl

Well FatSpeed does not even work with TOS 1.4 and is not needed, would be a lot
better for you to get TOS 1.4 Roms fitted, TOS 1.4 has a lot less bugs and some
nice features..

Note: FatSpeed must be the first thing in your Auto folder and not what is
shown by the desktop directory..

Get Autosort from memory, this lets you place files were ever you like them..

>
>If typing 'x filename' in a parameters dialog is too difficult for you,
>Roger, I suggest you move to the Mac.

I don't claim to have the latest/greatest version of zoo, but the
version I have has a bug that I am sure has shown up in all versions (no, its
a feature!) because it is in the documentation. Actually, it probably only
applies to zoo for Atari and IBM:

You _CANNOT_ simply click on your zoo.ttp (or if you have zoo.ttp
installed for *.zoo, your .zoo file) and type "x filename" because the Atari
(and the IBM) are NOT case sensitive and you end up calling the "X fileneame"
command which is DIFFERENT and will not extract your files.

You can however use the "-extract filename" (but I don't use this much
- I consistantly, like ~60%, get bombs, but I haven't investigated it enough
to know if it is due to my 512k machine, or my 40+ folder limit - the plus
is there because I have the ICD boot software). It is not due to autoprogs.

>
>> and Has very severe limitations...
>
>Name one.

That nasty bug of not creating folders for you - this is a serious
bug if you are making relative restores and _do not_ have the original
directory structure so that you can go ahead and make the folders yourself
(which is precisely counter to making relative archivals in the first place).
Even if the archive has only a simple, single-directory structure, the
inability to create a folder to match the destination string is an oversight
that should be a relatively minor fix, and the fact that it (apparently) has
not been fixed makes you wonder why it hasn't.

But you must have been using a shell, or you could not have used the
ol' "x filename" bit - only shells impart case sensitivity, and not all of them

do (but most do). Granted, you can use the "basic" commands.

>
>Too complicated for you, Roger?

This is not too complicated (come on!), but it _is_ completely counter
to the reasons for making relative restores (see above). Also, this is TOS
dependant - you can't do that two-button default directory setting on
preTOS1.4, and believe it or not, there are a lot of us still around with those
old TOSes.

>>Also Zoo 2.1 will crash with some types of ZOO files........

>archive here on my Unix account just as easily as at home; try that with
>LHarc (though with any luck the recently-released lha 1.00 sources might
>take care of that).

You are right that you see more questions pertaining to LZH than to
zoo, but isn't that because ZOO started out with the LHA5 compression? Even
if it didn't, I am sure that the pre-LHA5 versions didn't work on the high
compression zoo files either. Most of the problems with LHZ disappear once
the user gets a LHA5 compatible version. So since when is change for the
better, at the price of incompatibility, reason for dumping the program?
Just get the new version - nothing hard or even new about that, is there?
As far as I know the LHA sources are not new, just no one bothered to find
them. However, I think someone posted they will put them up so you power-

user types can use your crays to compress/uncompress those demos 2 minutes faster. :)

>Face it, Roger, Zoo has virtually identical functionality and
>compression ratio to LHarc, is just as widely available and infinitely
>more standardized.

Granted, similar algorithms give rise to similar stats. You say poe-tay-toe, I say poe-tah-toe. Pick yer flavor. But I don't see that it is "infinately" more stadardized. If you have ever used Archie, try a "prog .lzh" and come back to the screen the next day after it finally stops scrolling the files with the .lzh extension.

Not knowing a thing about the tech side of things i'll add this...
how long distance was that call.... Was it going through a satellite(sp?)?
If so, you may have noticed when you've been using voice through one of
them that there is a delay of a few seconds in the time it takes the
air-waves to go around the world (I think that's why). Also, some
LD calls i've made seem to be 1/2 duplex.. i.e. only one person could
talk at a time (like a speakerphone).

I'd have to agree with that, the only message from atari about it that i've seen is one that said they have been released to developers that someone posted here from GEnie. The rest have been people that have seen them or just heard a rumor from someone else.

Tell me something, do the owners of older machines from other companies go as crazy in the rumors like we do over new releases??? :-)

In VDI-Benchmarks (Text, Polygon...) my Mega STE+NVDI is in each case faster
than a plain TT.
NVDI is a full sreen-driver. Warp 9 only patches the old one. This
makes much trouble with new TOS releases (It is documented what a
driver does, not how).

436. HELP - Filecopy betw. floppies of diff. format

Newsgroup: comp.sys.atari.st
Date: 1992-07-13 09:29:42 UTC
From: otv@hal.nta.no
Message-ID: <1992Jul13.092942.10322@nntp.nta.no>
Source record: 219897

Does anyone know about a way to make *file*copies between floppydisks of different format?

I am considering to start formating my floppies to 86 Tracks/11 Sectors to increase the capacity from 720k to 930k. But I have to use the DOS format (79/9) sometimes, e.g. when I do ftp via a SPARC- and a DOS-machine. I get problems when I try to copy a file from a 79/9 to a 86/11 floppydisk. The destination floppy becomes "unreadable" and impossible to open from desktop and sometimes the system hangs up. I use the UIS III for filecopy. I have a STe 1040 with TOS 1.6, 2Mb of RAM and 2 floppies.

I know about the possibility to make a *disk*copy between different formats using Fast Copy III, but this doesn't seem to be a very efficient solution when there is only one file to be copied onto a floppy that is already half filled up with other stuff. This would then include a third floppy.

Cross-posted to: ont.forsale,misc.forsale.computers,comp.sys.atari.st

For Sale in South-Central Ontario (all prices in Canadian dollars):

Mega ST 4 (3.5 years old, new internal floppy drive).....$350.-
Byte Size Systems 50MB 28ms hard drive.....$300.-
SM124 Mono Monitor, good alignment.....$100.-
A _lot_ of software, with manuals.....(very cheap, or free with above)

Entire package, plus free power bar.....$700.-
(save more than $50.-)

(Newer) mouse, detached keyboard, etc. included with the Mega 4. This is an ideal system for a current ST user who wants to upgrade without losing software compatibility. It is very reliable.

Free delivery and installation within 60-90 minutes of Metro Toronto for a large (>$200.-) purchase. Payment by money order or certified cheque, but WE WILL PAY YOU BACK FOR THE SERVICE FEE (just keep the receipt). Send me a message at meggin@epas.utoronto.ca, or call at (416)778-5494.

David

The Keeper of GEMDOS and Chief Loremaster, as he once called himself,
has not been replaced yet. I believe Ken Badertscher has taken up the slack
and is now 'running the show'.

First Landon Dyer then Alex Leavens and now Allan too. I'll miss him too.
He did good work for Atari shaping up TOS and writing the ALN linker to name
some. He was also pretty good at slapping us about for abusing TOS. :-)

That's a rather surprising question: filecopy should be MUCH easier than diskcopy between different format (don't forget that a floppy hasn't the same format than a harddrive but there should be no problems copying a file between fd and hd).

The only problem could be that your format is too big: reliability suffers a lot when using 11 sectors/track and a lot of floppy drives can't acces 86 tracks !

Please limit your wishes: 10 sectors are just nice !

I believe there is something named "serialfx.arc" somewhere there. I
used it for a while and when I uploaded with XYZ.TTP, I always got a
message saying something about the receiver not notifying the end of
the transfer. Still, after the upload, the file I uploaded was in the
file directory of the BBS. Anyway, I switched back to TurboCTS which
works fine.

>Anyway, now that I have a 14.4k modem, I tried calling a couple of long

>compared to the 3000 it was doing to begin with!) Each block was sent at
>about 2500-3100 cps, but that annoying pause about every 50 blocks sent
>the average cps WAY down.

Unless you have some hardware patch that upgrades your serial port to
38400 bps, it isn't possible to upload (or download) at 3000 cps. I
too get that kind of CPS ratings when uploading, but I think it's
because the can't count the CPS rate right at so high speeds, it's too
busy sending stuff to the serial port. I too get those pauses between
blocks, only they are more frequent, maybe each 20 blocks or so, but
the average transfer rate (according to the receiving BBS) tends to
result in about 1600 cps.

> <Text deleted>
>
>Why am I getting these pauses? Why can't I get 3000+ cps on other 14.4
>boards? Why wasn't the upload completed in the first place?

The pauses during the upload (I assume they only occur while
uploading?) happen because your modem can't send data out on the line
as fast as your computer transfers data to it. So, when the modems
buffer becomes full, it drops the CTS line and the computer stops
sending to it. When the modem has emptied it's buffer, the computer is
allowed to transmit data again. I think that i fyou try uploading text
files (which tend to compress very well), there will be no pauses

during upload.

#
#
Not to nit-pick or anything (I mean, heck, this is basically vapour-
ware we are talking about - except for the fact it HASN'T been _officialy_
announced), but the SCSI 2 capability has _NOT_ been reported in any of the
reviews I have seen. In fact, the only time where I have heard Falcon (or
other alias) and SCSI-2 mentioned in the same article was in one of my earlier
speculative posts on whether Atari would Make The Right Move (tm) and Do
The Smart Thing (tm) by going to SCSI-2. :)
#

Hmm, ST Format claim from their 'insider' sources at Atari that the Falcon does indeed have SCSI-2, though I'm not sure if I trust STF's speculations any more than Internet's !
As for the Falcon not being officially announced yet, Atari have at least officially announced that they're going to officially announce it :-)

Sam.

>
>-- David Paschall-Zimbel

Bzzzz! Wrong. (Sorry, couldn't resist.) I have PC Ditto I version 3.71
(if I remember correctly) and it works perfectly FINE on mono. That is
the only way that I use it. (I run Quicken for all of my financial
needs.)

What I did (and my system is super-stable) was to get a copy of PC DOS
3.3 (*not* MSDOS 3.3 - there is a difference) and always boot from
floppy. I used this setup to have Quicken access the CheckFree service
via modem while under PC DOS. Excellent software product. Just make
sure that you run the menu (setup) program and correctly identify your
system config.

FYI - Now I have a SuperCharger and boy does Quicken fly! (BTW, I still
use the same PC DOS 3.3 - works much better (IMHO) than the 4.01 that
comes with SC.)

I think what we need if a TOS filesystem which waits until the drive is quiecent before writing the FAT out, storing the machine's image of the FAT in a fast-lookup format, preferably a hash table or a tree structure. I'm sure that'd speed disk I/O a great deal.

I'm offering my Atari 1040ST Computer for sale.
Here's what it's got:

- 1 Meg Memory
- 68000 Processor at 8Mhz
- High Resolution Colour Monitor (Sharp!)
- Macintosh-Style user interface (Mouse-driven)
- Double-Sided 3.5 inch floppy, plenty of disks
- Built in MIDI port for musicians
- Dr. T's MIDI Workbench & MIDI cables
- Lots of Public Domain Software (Gulam, uEmacs, vi, etc.)
- Word Processor, Games (Robotron, King's Quest, Thundercats, Joust)
- Boss Game Controller (Joystick)
- Madmac assembler, Public domain C compilers (Sozobon, MJC)
- Loads of software on the market
- Built in modem port, printer port, hard disk connector

Yours for $600 -- make me an offer!

e-mail to orpen@fields.uwaterloo.ca, or call Keith at (519) 725-9324.

451. Want single sided drive mechanism from an ST, hd interface

Newsgroup: comp.sys.atari.st
Date: 1992-07-13 15:51:11 UTC
From: dont@klic.rain.com
Message-ID: <1992Jul13.155111.20148@klic.rain.com>
Source record: 219762

Anyone have a single sided drive mechanism, pulled from an ST when upgrading to double sided, that they would sell cheap? Looks like 5 years of use has work the old drive out. (would consider a double sided mechanism too)

Would also be interested in an interface to add a hard disk.

How about Sim City, Balance of the Planet, Maple, El Cal?

Thanks
Don Taylor

>discontinues the product.

Copyright is held by the copyright holder, or such entities as represent the copyright holder (trustees of an estate, court trustees of bankrupt companies, or the 'original author' of a work, for example).

The folks who wrote PC Ditto are still around. I would suspect they would NOT be willing to ignore breaches of copyright.

Unfortunately, there are a number of programs which one can no longer obtain except through second hand purchase. Then again, with the advances in computer technology, and program sophistication, over the past 15 years, I highly doubt that many people would be content with many of the earlier programs.

For example, the software version of PC Ditto is no longer sufficient if you desire the power and speed of an Intel '286, '386 or '486 processor.

>old TOSes.

Are you sure about this? I'm almost certain I was using this trick long
before I upgraded.

> You are right that you see more questions pertaining to LZH than to
>zoo, but isn't that because ZOO started out with the LHA5 compression? Even
>if it didn't, I am sure that the pre-LHA5 versions didn't work on the high
>compression zoo files either. Most of the problems with LHZ disappear once
>the user gets a LHA5 compatible version. So since when is change for the
>better, at the price of incompatibility, reason for dumping the program?

Not in itself; it's when this happens every six months or so that it's
a problem. It's aggravating constantly hearing "Stupid, you should
have version XY17" when just last month you got version XY15 on the
assurance that it was the be-all end-all Lharc and would unpack any
.lzh file you threw at it.

>Just get the new version - nothing hard or even new about that, is there?

Ah, but which one? That's my point. There are several versions of
Lharc currently available, half of which are incompatible with the
other half, and most of which claim to be able to unpack everything.
There is _one_ version of Zoo currently available, and it _does_ unpack
everything.

>As far as I know the LHA sources are not new, just no one bothered to find
>them. However, I think someone posted they will put them up so you power-
>user types can use your crays to compress/uncompress those demos 2 minutes
>faster. :)

It's not those two minutes that I'm worried about, it's the half-hour
I'd otherwise have to spend downloading the archive at 1200 baud before
I could even read the README file to see if it's of any use to me.

> [...] But I don't see that it is
>"infinately" more stadardized.

By this I mean that I can have the latest and most compatible version of
Zoo anywhere there's a C compiler. The latest and most compatible
version of Lharc only compiles on an Atari (and probably only with

whichever assembler Questor used), and until recently, the source was nearly impossible to find anyway. With any luck the Lha 1.00 sources that were recently made available will fix this problem [of course, the way things are going, Lharc v2.02 will probably end up being incompatible with it :-( ].

> The bombs happen 95% of the time in the print function, after about
>20 seconds.

I don't think my problems are memory related, since I have 3 megs free, and the symptoms don't seem memory related. Wordflair II bombs if I do any of the following things:
- re-define the size of the printable page.
- define a new point size on the fly (especially a large one!)
- place a text region off of the "Background write" region.

Because of these symptoms, I don't think it's a memory size problem, but a memory allocation problem. Someone is stepping on somebody else's memory (or it's own memory). I'm starting to suspect that Wordflair II is the culprit, though.

458. PC Ditto release numbers

Newsgroup: comp.sys.atari.st
Date: 1992-07-13 18:32:48 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1992Jul13.183248.1880@news2.cis.umn.edu>
Source record: 219765

Just a quick note to go with the current discussion about the software version of PC Ditto ...

Version numbers may vary depending upon the country of posting. As an example, the last version of PC Ditto for which I have reliable information in the United States is either 3.01 or 3.1. Several folks from New Zealand have mentioned a version 3.96.

It would perhaps be best to make note of the version number and any other information (copyright dates, country of origin) when asking and/or answering questions about this program. It is entirely possible that enhancements and/or bug fixes were made in a particular version.

-- David Paschall-Zimbel

P.S. To the person inquiring about Hard Drive partition recognition ... Do you have an Atari hard drive? Atari drives formatted under AHDI require a special program which writes some information in the boot block which PC Ditto needs to recognize the drive. I haven't encountered this problem with the ICD drivers, but seem to remember similar problems with early SUPRA drives.

459. Atari Trakball to mouse conversion

Yo!

I am searching for instructions to make an Atari CX80 Trakball behave as a mouse. Does anyone have some? And, is the right Trakball button working as a right mouse button or just as an additional left one? I hope the CX80 is the Atari Trakball model that is to be modified, the package was quite old ((c)1983), and as far as I have heard, there are newer models one cannot modify.

461. For Sale: 80 MEG EXTERNAL MAC SCSI DRIVE

Newsgroup: comp.sys.atari.st
Date: 1992-07-13 18:53:59 UTC
From: joey@elysium.CS.Berkeley.EDU
Message-ID: <13sjg7INN1g1@agate.berkeley.edu>
Source record: 219769
Cross-posted to: comp.sys.amiga.marketplace,comp.sys.atari.st,comp.sys.mac.wanted,comp.sys.mac.hardware,ba.market.computers,su.market,ucb.general,ucb.wanted

I'm selling an 80-meg external SCSI hard drive. The case/power supply is by LaCie (originally housed a LaCie Cirrus 30), and the drive in the case is a Quantum, purchased from Hard Drives International in November 1990. Comes with a recent version of Silverlining formatting software (from winter 90/91), loads of PD software, and System 7 installed.

If desired, I can also sell MS Word 4.0, THINK C 4.0, and/or Fastbask II, including original floppies and manuals.

I'm selling the drive because my Mac died. It works great -- fast and quiet. I have original invoices for both the case and the drive. I also have mounting hardware if you prefer to install the drive internally.

I paid $500 for the Quantum alone in 1990. The case and power supply is worth about $100. I will, of course, accept substantially less than that, given that the drive is used. Asking $300, but make an offer.

Mail offers to joey@postgres.berkeley.edu, as I do not read these groups with any frequency.

Hello Ian,

about a year ago I had the same problem and found the
Frankenstein Cross Assembler for the Atari ST called
AS8051.ZOO

It's (how one easily can see) for the 8051, but I think
there are no diffences in the memnonic to the 8031.

I'm sorry that I can't remember where I found the file,
but ARCHIE should solve this problem.

I hope I could help you.

Bye,
Tobias

467. mono monitor problems

Newsgroup: comp.sys.atari.st
Date: 1992-07-13 20:54:43 UTC
From: klassa@aurs01.UUCP
Message-ID: <60915@aurs01.UUCP>
Source record: 219775

Hi-

This is sort of a repost... I didn't get any responses on my last
post so I started to wonder whether my message had made it to the net.

At any rate, my mono monitor has started to flake out. The width of
a line of text has started to vary from place to place on the screen...
At the top, a line of text is about a half inch or more tall; at the
bottom, perhaps an eighth. In between, it seems to vary more or less
linearly from top to bottom. The number of scanlines per line of text
hasn't changed, just the width of each scanline, really.

Are these the same symptoms I've seen reported elsewhere -- the "infamous"
symptoms that mark the impending death of my monitor? Does this sound
familiar to anybody? Is the end near? Can it be fixed?

Thanks!
John

When I saw this on usenet sometime over the past couple of weeks, I went home and tried it. It worked fine, and I've found good uses for it ever since. AFTER I tested it, I read on here that it didn't work on the early TOSes. I guess you'll have to chalk this one up to another case of my ST being too ignorant to know it can't do it, since I'm running TOS 1.0 (1985).

To whomever originally posted this trick, thanks. I would never have discovered this on my own, and it's handy for many tasks far beyond unarchiving. It should probably go in the FAQ for new users.

469. pagestream upgrade

Newsgroup: comp.sys.atari.st
Date: 1992-07-13 21:12:38 UTC
From: wmagro@uiuc.edu
Message-ID: <BrCIx3.4u@news.cso.uiuc.edu>
Source record: 219777

I upgraded my pagestream 2.1->2.2b yesterday. It seems that screen redraws are a bit quicker, though the same font display bugs are there.

The real joy came when I went to print on my deskjet. Two bombs is all I got. I rebooted with a completely clean system, and still got two bombs. I reloaded the old deskjet driver--two bombs. Whether printing to file or to the printer I always get two bombs.

As a test I printed to disk with other drivers, and there was no problem. Is anyone else seeing this wacky behavior?

The above construction is a predicate adjective. To discuss the plural
form of an adjective is, of course, pointless.
```

471. never mind...

Exactly the problem, even with a fully functional RTS/CTS patch the ST can
only manage about 2500cps reliably. I've tried this with various things
hooked to the ST and always get around 2500cps. So if you have a 14400bps
modem that's running V42b on a textfile, the ST can't cope with the probable
3300-3400cps data rate, your RTS/CTS patch tells the modem to stop while it
catches up and somewhere along the line you loose some data.

>that is good, but I dont think so...
>

Well, the way I figure it, a 2400 baud modem can never go faster than
300 CPS, at least not without any type of compression (that is, a normal
2400 baud modem). Then add in the error checking and whatnot, and you
get an average (non-compressed, remember) speed of about 230 CPS. So,
a 9600 without any compression would max out at 1200 CPS, with an average
somewhere around 920 CPS. It seems that you're doing pretty good at
1450-1650, especially if you are transferring compressed binaries and
stuff. This is a perfect example of how the compression can eliminate
the overhead required for error checking and then some.

>Also, have you found any FAX software that works with the Modem? I
>haven't found any yet... I have heard of a program called Fastfax or

>(I know it would be futile to do so with .LZH or .ZOO)?

V42bis will only do 4:1 on the right kind of data, I seem to remember this
has to be a set of repeated 6 character strings.
On 'real world' data 2:1 is probably over optimistic.

For an example of what ARC can do look at this:

```
Name Length Storage SF Size now Date Time CRC
================ ======== ======== ==== ======== ========= ====== ====
TEST.TXT 29867 Crunched 99% 115 13 Jul 92 11:11p 1e1c
```

Again, this is the 'right' kind of data - a file full of spaces, but gives
something like 259:1

Well, there is still the option to patch the GEM and burn it.
WINX 2.0 has an Option to patch a TOS.IMG File (or readout the TOS and patch
it). I have just done that and now I have WINX in ROM and save the ~150KByte
which otherwise would be used for the GEM in RAM.

Really nice to have all that nifty features without "loosing" memory. ;-)

I am not sure if either of these two have been mentioned, but:

Pet computers (ancient Commodore stuff): There was a particular
poke one could perform that would case the processor
to get caught in an ever-increasing tight loop. Eventually,
heat would destroy the processor.

Pyro Virus (a bit more violent): PC virus that will detect the
presence of a multisync monitor, wait for several
hours of inactivity, and will resync the monitor to a
very small area in the center of the screen. If it is a
good multisync, you get a dot permanently burned into the
phosphor coating. If it is a cheapy, you get implosion and
possible flames (hence the name).

>Or, one might say, there's still no excuse to use Pagestream, even though it
>can now import CVG files. ;^D

Hah! Well, it doesn't matter HOW good Calamus is! The fact is that
more people use PageStream, and that makes it BETTER. Besides, Calamus
is just for games. And to upgrade Calamus, you have to void the
warantee and open it up, while with PageStream, it's a simple matter of
plugging in another bored, because it's an open system. Sure, the
display is slow, but that's just because it isn't designed for
animation, which isn't necessary for SERIOUS decktop publishing. And
now, with PageStream 5, you can have documents larger than 640K
(provided no single object is larger than 64K, but that doesn't matter,
since only game-desktop users need that).

><nudge nudge> <poke poke> :^)

:-)

--
Warwick
ps. Yes, this is an attempt at jest. Both programs have there own
advantages and disadvantages. PageStream, as far as I know is not
limited to 640K, and it's actually EASIER to ad features to Calamus SL
than PageStream (Although the same can probably not be said for
original Calamus.

It's been a long time since I've reposted this, so here's the "trackball
hack collection". I can't remember if it's mentioned in the stuff below,
but in spite of having a few hacked trackballs around, for the past year
or two I've been using the Microspeed AmTrac trackball. The ball motion
isn't nearly as smooth as my Wico (cheap plastic bushings instead of
ball bearings), but the huge buttons surrounding the ball make it much
easier to use than any other trackball I've seen. Of course I couldn't
leave well enough alone. I've hacked the AmTrac to use the middle button

as either the standard clock-hold function or as the middle mouse button. Sorry, I haven't documented that hack, but all it took was a new (9 wire) cable, a switch, and a bit of fiddling.

NOTE: Some of the info below is redundant, and some hacks are much easier to do than others. Read the whole thing before digging out your tools.

The flow of hacks never stops, appended to the end are a couple of hacks found in comp.sys.atari.st. With minor changes, they'll work on the Amiga.

Blaine Gardner 2/19/91

%%%

A one line mention of my trackball hack has stirred some interest again, and since it's been more than a year since I posted it, I'm reposting my trackball-to-Amiga-mouse hack. I'm also including the other two trackball hacks that have appeared on the net. Choose the one you like best, and kiss your warranty goodbye!

==========
Notes from George Robbins on my original posting:
==========
Per request, I am reposting the original article on converting WICO and perhaps Atari 2600 trackballs to mouse-compatible devices. While I have not tried the conversion, what the original author describes seems to be quite reasonable.

One other approach that might be easier would be to obtain a spare mouse, extract the little logic board and attach it to the various LEDs, photo-sensors and switches...

The original article in comp.sys.amiga describes how to convert WICO and Atari 2600 track balls to work with the Amiga. Converting for the Atari ST is essentially the same, except for some disagreement between Atari and CBM on which quadrature signals go to which "joystick" lines.

Pin	Amiga	Atari
1	Vertical X-B	
2	Horizontal X-A	
3	Vertical-Quatrature Y-A	
4	Horizontal-Quadrature Y-B	
5	Pot X N.C.	
6	Left Button	Left Button
7	+5V	+5V
8	Ground	Ground
9	Pot Y-Right Button	Right Button

As you can see, the pin-outs are compatible enough that no harm will result if the two are interchanged, however since the quadrature outputs don't match up you will get pointless twitching instead of useful motion. Simply switch the wires going to pins 1 thru 4 until you get it right.

A minor problem is that the WICO trackballs are discontinued, so unless you already know where to find one, you may have problems.

==========
My original posting:
==========
Original (corrected) article from blgardne@esunix.UUCP (Blaine Gardner):
~Title: Wico trackball mouse VERSION 2.0 (BUG FIX & ATARI NOTE)

Ok, here it is, sorry I took so long to post it. I have tried to make this understandable, if you don't know what an LM 339 or a DB9 is, maybe you shouldn't try this.

Wico track ball modification.

Converting the Wico track ball into an Amiga mouse compatible track ball is a fairly simple procedure. But if you are uncomfortable with a soldering iron, get some competent help.

You could damage your Amiga if you make a mistake when assembling this project! You could also void your Amiga warranty! You will definitly void your trackball warranty!

YOU HAVE BEEN WARNED!!!

Ok, now that that's out of the way here are the gory details.
The stock trackball contains a small pc board, this will be removed and replaced with one containing an LM 339 quad comparator.

The comparator simply converts the output of the opto-coupler to a TTL level pulse. Both the X and Y axis use two emitter-detector pairs. The output of each of these detectors is fed through one of the comparators. The output of the comparator is then fed to the Amiga's mouse port. Since the output of the trackball will be identical to the mouse's output, the modified trackball will work with ALL software that uses the mouse.

Here we go!
Remove the 6 (six) screws from the bottom of the trackball case and open it (right-side-up please). In the lower-right corner there is a small pc board with two connectors. Remove the board & connectors. You can toss the board, and the cable that has the joystick connector. (The cable only has 7 wires and we need 8. You can scrounge the 11 pin male header off of the board.)

Cut a piece of perf board the same size as the original board. Just make sure it fits in the same place as the original. The plastic grooves will hold it perfectly.

Two cautions here: make sure the top can be screwed down without hanging up on the new board, and make sure all your components will clear the standoff near the board!

Using the (crude) schematics below, wire up the circuit. You will need to drill a hole in the case to mount a second switch (for the right button). Make sure the second switch will clear all existing hardware! Wire the second switch between ground and pin 9 on the DB 9 connector.

It is a good idea to place a medium sized capacitor (10-20 uf) across +5 and ground where power enters the perf board.

There it is! The above information was obtained from the Amiga Hardware Reference Manual, and from tearing apart my mouse & trackball and tracing out the schematics myself. (Mostly from tearing my hardware apart!)

Any errors in the above information are mine (but for a few hours work they can be yours too! |^)), not Evans & Sutherland's. They are kind enough to pay me to play with their computers, they have no control over my ramblings here on usenet.

++
The above infomation is the correct version. In my first posting + 5 volts and button 2 were switched on the DB9 pinouts.

There have been a lot of inquiries about doing the same modification on the Atari 2600 trackball. I hadn't seen the Atari untill two days ago, but I can now tell you that the same procedure will work for it. In fact it is a little easier on the Atari trackball because the LM339 is already present.

Just remove all the components from the board except the 339, the supply voltage filter (inductor + electrolytic cap near the 6 pin header), and resistors R9 - R18. Actually you'll have to remove those too because they are the wrong values, and the 339 socket blocks several traces that need to be cut. (As I remember 430K and 10K should be swapped for 100K and 3.3K respectively.)

The biggest problem is that Atari wired the 339 as a non-inverting comparator, and Amiga uses an inverting comparator. So you'll have to CUT AND JUMPER (those that flinched may leave the room) to get the inverted configuration (see above data for the correct circuit).

I don't plan to do a detailed plan for the Atari trackball, if the above information doesn't mean much, don't try it yourself.

This general plan should work for all trackballs that use a pair of opto-couplers on each axis. The old TG trackball for the Apple II (and probably other computers) will NOT work since it uses a pair of pots.

I hope this helps all you hardware hackers that can't live without a real trackball. Have fun, and don't blow up your Amiga!

==========
Here is the second trackball hack that showed up on the net. This is the easiest one for the Atari 2600 trackball. (This WAS the easiest hack, check the one at the end of this article for the easiest Atari hack.)

~Lines: 43

I just bought a couple of Atari brand trackballs at the local hobby store for 14 bucks and decided to convert one of them to work like a mouse for my Amiga. I followed the instructions that were given a while back for Atari trackballs, and totally ruined the thing. After working on a second one, I studied the circuits myself and have successfully made the modification.

The first part of the modification is quite easy and doesn't need any soldering. THe second part will involve a minor amount of soldering and that is so that the right switch can be disconnected from the left and work like the mouse.

Part I. Open the trackball by removing the screws and prying the two halves apart. There will be a 6 pin connector at the end of the DB-9 cable. Scratch away the foil paths on the circuit board that lead to pins 1 through 4 from left to right. (Two of the foil paths are on one side of the circuit board and the other two are on the other side). Connect the following pins from the 6 pin connector to the pins of the LM339.

6 PIN CONNECTOR LM399
--------------- -----
1 -> 14
2 -> 2
3 -> 13
4 -> 1

I accomplished this by piggy backing a second socket on top of the LM339 and just plugging wires from the connector to the socket. This should complete

part I. To test it out, plug it in to the Amiga and try to use it like a mouse. Both buttons will work like the left button on the mouse.

Part II. In order to make the right button work like the right button on the mouse you will have to buy another cable. In the trackball I bought, there was no wire for pin nine of the DB-9 connector and that is where the right switch goes. So, cut off the old cable and solder the remains of the old cable to the new cable. Cut the red wire connecting the two switches so that the majority of the length is attached to the right switch. COnnect the wire from the right switch to pin nine of the cable. Now the trackball should work just like a mouse. Be very careful that you don't connect the wrong wires from the DB-9 cable to the six pin connector and switches. On my first attempt I switched pins 7 and 8 by accident and blew some of the chips on the circuit board.

I have already built this circuit and I don't believe there are any mistakes in this posting. I am sorry in advance for any mistakes there might be. Also, I have nothing to do with Commodore or Atari.

==========
This is the third (and final?) trackball hack to appear. The advantage of this one is it allows the Atari 2600 trackball to be switched between joystick and Amiga mouse modes. When I built it, the mouse response was pretty jumpy compared to the other two hacks. If you want a game controller, use this hack. If you want a smooth mouse, use one of the other two.

For those of you who've been waiting for an inexpensive trackball, here are the modifications for converting an Atari trackball (model CX22) to emulate an Amiga mouse. This device is different from the Wico trackball which has been previously mentioned on the newsgroup.

One nice feature of the Atari trackball is a joystick emulation mode in which it can be used in place of a joystick. It can be plugged directly into the Amiga and used in the joystick mode. Unfortunately a few modifications are needed to use it in place of the mouse.

KayBee toy stores in the Boston area currently have these things on sale for $9.99 so you should be able to have a fully functional trackball for well under $20.

For those who grow squeamish at the sight of a dismantled trackball, it is possible to build an adapter that can be plugged in between the Amiga and the trackball. The only disadvantage of the adapter apporach is that the second trackball button cannot be used as the right mouse button. Please send me email if you would like instructions for constructing the in-line adapter.

Disclaimer: While I beileve that the instructions provided here are correct, I do not claim any responsibility for the results of your actions. I seriously doubt you can injure your Amiga even if you make a mistake in construction; I do not know if the same can be said for the trackball.

Now for the moment you've all been waiting for. You will need a 74LS86, a 74LS157, and one Radio Shack joystick extention cord (or equivalent 9 conductor cord with a female DB9 connector on the end). Note: Radio Shack does not carry the IC's, but they should be commonly available.

The cord is necessary because the trackball comes with a 7 conductor cord, making it impossible to use both buttons separately. Unfortunately all the Radio Shacks in my area are out of the extention cord thus I had to reuse the cord that came with the trackball and do not yet have a functioning right mouse button.

Open the trackball by removing the four screws on the bottom of the case. Separate the two halves of the case by holding on to the bottom half and pushing a screwdriver through one of the two holes near the middle of the case (they look like they should have recessed screws in them but there aren't any screws). Be careful when separating the two halves otherwise the ball will land on your foot and roll across the floor :-).

In the upper left corner there is a 6 pin connector to which the incoming cable is attached. Remove the connector to expose the six signal pins. I will refer to these as T1 thru T6 (from left to right). The signals on the pins are:

Pin	Joystick Mode	Trackball Mode	Wire Color
T1	left	vertical direction	green
T2	right	vertical pulse	violet
T3	up	horizontal dir	white
T4	down	horizontal pulse	blue
T5	+5 V in	+5 V in	orange
T6	ground	ground	black

The horizontal and vertical pulses (T4 and T2) can be fed directly to the Amiga (to the right pins of the game port, of course), but the HQpulse and VQpulse required by the Amiga must be constructed from the available signals. The HQpulse is simply the XNOR of the Hpulse and the Horiz. direction. Similarly the VQpulse is the XNOR of the

Vpulse and Vert. direction. The two XNOR gates are implemented using a 74LS86 (quad XOR gate). The 74LS157 is a quad 2-to-1 multiplexer that is used to preserve the joystick emulation mode.

CONSTRUCTION NOTES

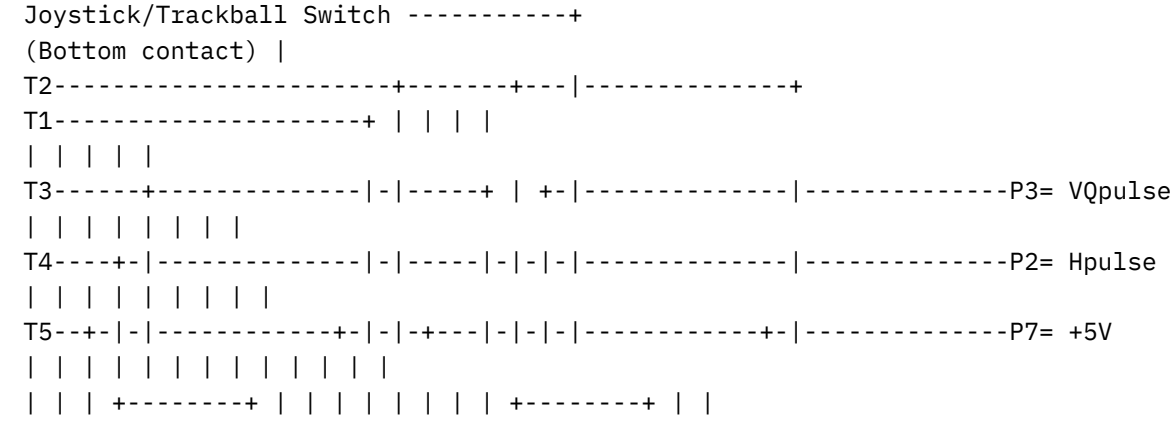
There is plenty of room inside the trackball case, so you can choose just about any construction method you desire. I chose to wire wrap the circuit on a tiny piece of perfboard and mounted it in the right side of the case. I attached the circuit to the trackball by wire wrapping directly onto the posts exposed by removing the six-pin connector. I soldered the incoming cable onto a DIP header (also from Radio Shack) which is then plugged into a third socket on my little circuit board. Being able to easily remove the cable is a big plus since you can keep it out of your way 'til the very end.

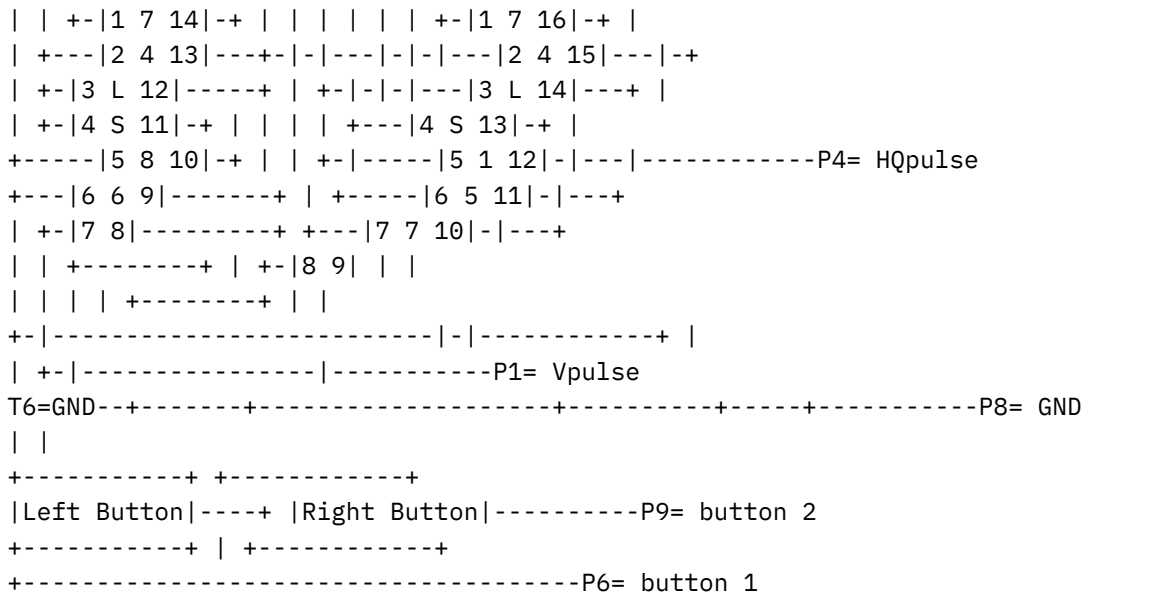
The schematic below shows how to construct the little circuit board. The pins on the gameport connector are referred to as P1 thru P9. Connect the circuit board to the appropriate pins (T1-T6 and P1-P9). The joystick/trackball switch is the little slide switch near the lower left corner of the trackball (top view). You will need to solder a little wire to the bottom-most of the three contacts on the switch.

To get to the contacts on the bottom of the switch, you will need to remove the PC board in the trackball. Lift out the "cue ball" and the two rollers it is resting on. Then remove the two screws holding down the PC board and lift it out. Reverse the process after you've attached the wire to the switch contact with a dab of solder.

To wire the buttons, do the following:
1) Cut the red wire connecting the two switches together.
(also cut the red wire leading to the incoming cable).
2) Connect the black wire to ground (T6).
3) connect the red wire from the left button to P6.
4) connect the red wire from the right button to P9.

SCHEMATIC





TROUBLESHOOTING

Reassemble the trackball after making all connections. Set the joystick/trackball switch to "trackball" and try using the trackball in place of the mouse. If all has gone well, your pointer should move smoothly in response to the trackball movement.

If there is no movement or the movement is *very* jittery, double-check your connections. It is very likely that something is not connected or that two signals have been switched. It may help to try out the joystick emulation mode if you think signals have been crossed (it'll be easier to tell which signals have been crossed!).

Good Luck!
Rajeev

~Lines: 32

I just got through reading a whole bunch of ways you can modify
track balls to make them work with the Amiga. I don't know about
the Wico track ball, but for the Atari track ball there is a much
simpler circuit mod than any of those listed. The instructions for
opening the case and adding a second mouse button were correct and
as simple as can be done, so I won't repeat them.

On the 2600 track ball circuit board there are 6 test points along
the front of the circuit board labled TPx where x is a number.
Near the cable connecter there is an IC labled 4019.

instructions:
1) pull out the 4019 IC
2) bend out pins 1,3,5,7
3) put the 4019 back in its socket
4) connect pins 1,3,5,7 to test points TP3,TP2,TP4,TP1 respctively
5) your done, you now have a 1 button track ball.

Comments: This assumes the 4019 is socketed, it was in mine, but since
Tramiel took over that may have changed. This mod keeps the function
of the joystick/track ball switch. I did this back when marble madness
came out, but did not have access to the net to report it at that time.

Disclamer: I poped open my trackball to check this as I wrote it,
however I still disclaim any resposibility for its accuracey or any
problems it causes. Do this at your own risk!

I also modified an Atari 5200 track ball to work as an Amiga mouse,
but I doubt anyone can get one of those, besides, those used brass
shafts to support the ball, and they wear out too fast.

(hows this for a short signature?) Douglas Peale

==========
Ok, as of July 1989, this is the complete list of trackball hacks. If
there are any more, please let me know.

Blaine Gardner.
==========
And one more! As noted at the start of this file, the two hacks below
are for the Atari ST, so make sure you get the pinout right for the
Amiga.

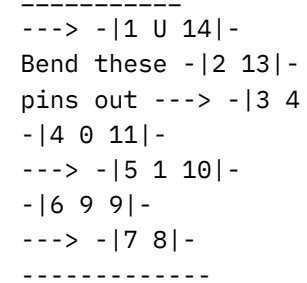
~Lines: 87

Several people have asked me to post the description of the modifications to
and Atari 2600 trackball to have it work as both a joystick and a mouse for
the ST. Below is the semi-detailed plans I wrote up to perform this mod.
Let me know if any corrections are necessary. Thanks.

Atari 2600 Trackball -----> Atari ST mouse

Here are the mods necessary to convert an Atari 2600 Trackball for use
as a mouse for the ST. Notice that this mod will allow the trackball
to also function as a joystick depending on how the switch on the bottom
of the trackball is set (T=mouse, J=joystick). The only major drawback
of this mod is that the trackball has only one button...the left mouse
button. (but, hey, how many programs use the right mouse button?)

OK, here goes...
1. Figure out how to open the trackball.
There are a few (4?) screws on the bottom of the trackball. Once
the screws are out, you should be able to pry the top half off.
2. Take out the ball (looks like a billard ball!).
Look on the board for a chip marked 4019. If this chip is socketed,
you're lucky (the mod is much easier). If it is not, well...
In any case, this chip has to be removed. DON'T destroy it! It
is still needed. Normal CMOS precautions apply. Static can KILL!
--At this point, you should have the 4019 out of the circuit. If it
was not already in a socket, I would suggest putting a socket in.
3. Find the pins 1, 3, 5 and 7 on the 4019 chip. Use the diagram
below if you are not sure. Bend these pins up so that they point
either up or out to the side. These are the pins that will be used
for the 4 wires in this mod. They will not have to be reinserted
into the socket where the chip belongs.



4. To make things easier to solder, reinsert the 4019 into the socket.
5. Now, 4 wires must be soldered into the circuit. Use the table
below to know which wires go where. All connections to the circuit
are either to the 4019 or to Test Points (TP) on the circuit board.

Pin # on 4019 | Connection point
---------------+--------------------
1 | TP1
3 | TP2
5 | TP4
7 | TP3

6. Recheck all the solder joints to make sure no solder bridges exist.
Reinstall the billard ball onto the rollers.
7. Close up the trackball. Set the selector switch on the bottom of
the trackball to T (trackball=mouse). Plug it into the ST and
Boot up the computer. Try it out. All should be OK. If the
pointer movement is not correct, then a connection was not properly
installed. Pull everything apart and recheck.

You should now have a functioning track-mouse (or whatever you want to
call it). I derived these plans from some I saw on the net for making
the Atari trackball work on the Commodore Amiga. I have also seen
plans for making the trackball work on the ST, but the joystick
functioning was messed up.

If you have any problems/questions don't hesitate to send me a note at:
BGB100@PSUVM.BITNET
No guarantees on a quick reply (final exams and holiday break coming up
in a few weeks). Also, I must include the standard disclaimer. I have
built one of these and will be making another for a friend soon. I
have experience in working with Atari computers and electronics. If
you are not sure of yourself, ask someone you know for help. I don't
mean to discourage anyone from trying, but I cannot take responsibility
for anyone else's mistakes. If I have made an error in these plans,
I appologise. If you find a critical mistake, please let me know.

With all of that said, Good luck and happy trackballing!

Bruce Blanar

~Lines: 48

Below is a decription of the mod need to be made to a Commodore Amiga mouse
to get the mouse to work on an Atari ST. The Amiga mouse offers a faster
(slightly) tracking rate and two very comfortable buttons to use. The
mod is easy to do and provides a very nice mouse. Enjoy!

Commodore Amiga mouse -------> Atari ST mouse

This is the mod for a Commodore Amiga mouse conversion to ST mouse. No
big deal about the difficulty of the conversion, but still be careful
about what you do. I have included the original wire order by color so
that if you do mess something up, it is here. If the wires in your
mouse are different colors, I suggest writing down the color order before
starting in case you switch the wrong wires. Then you can go back to
START and begin again.

OK...here it is. All it involves is switching two wires on the connector
going to the mouse circuit board. I'll give the before and after views e
of the connector wires in order from back to front (of the mouse).

Before To use on an Atari ST
--------- -----------------------
Black Black
Blue Blue That's it!
Brown -----\ /-------- Yellow
Orange \/ Orange
White /\ White
Yellow -----/ \-------- Brown
Red Red
Grey Grey

Like I said, the mod is not difficult. The standard disclaimer applies.
I cannot take responsibility for any misfortunes that may befall you
because of your using these plans for the mod. I have performed this
mod and I know it works. I ripped the whole mouse apart trying to figure
it out before I found out I just had to switch two wires. If you need
help with the mod, ask someone you know who has the expertise to do it.

Good luck!

481. WriteNow3.0 on Spectre

Newsgroup: comp.sys.atari.st
Date: 1992-07-14 03:31:40 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1992Jul13.233140.4072@newstand.syr.edu>
Source record: 219798

Is anybody using WriteNow 3.0 on Spectre? I've used earlier
versions of WriteNow and been very happy with its performance
(it is small and fast). I have not been able to get v3.0 to
work, however. It appears to install perfectly fine, but
always "unexpectedly quits" when I try to run it.
Does anybody else have a different experience?
Thanks,
Gerry

I am at home right now and I just tested this. Although I can run the
program in the non-topped window, it does _not_ set the default directory to
the topped window. I ran 1stword with my telcomm directory topped and the
1stword dir was the default. I ran Uniterm with my 1stword dir topped, and
the default for all loads was the Uniterm directory. Were you able to get
the correct default directory? If so, what program were you running? I have
a 520ST with TOS 1.0 in ROMs. I guess perhaps my computer is too smart and
it "learned" some bad habits....:)

>modem is irrelevent to the speed at which the modem connects to another modem.
>You could conceivably have a 76.8k connection to your modem (if it could

<stuff delete>

Yeah, I know. What I failed to get across is that my 9600 connection to
another computer is done via null modem. I NEED to be able to set my
cpu down to 9600, so I'm not willing to lock my system at 38400 (
although I'd sure like to see it once!)

Got any idea where I can find the HSPD_232.ACC file I keep reading
about around here?

If you do the crystal change, you won't be locked in at 38,400baud, but you *will* need to patch your XBIOS Rsconf routine to set the right delay values for each speed, and to allow you to select faster speeds than 19200. Then as long as all your telecom software uses the standard Rsconf values to set the serial port speed, as opposed to messing with the MFP timer directly, you'll be OK. There's really no good reason for a program to be tweaking the timer itself, unless the program is trying to use the timer for a purpose other than a baud rate generator, which is really reaching...

Hm. I think I missed something, it occurs to me that to get 38400 baud thru the MFP, you need a crystal twice as fast as the current one. The current one is 2.4576MHz, and doubling that would exceed the MFP's maximum clock speed of 4 MHz. That's assuming you stick to playing by the rules and using async mode. If you get rid of that internal divide-by-16 you get a much wider range of possible speeds, but it's never seemed too reliable to me.

>or a bit less. It depends on how well the compression has been done, but
>V42bis appears able to squeeze a bit more out.

Hm, let's think about this a bit, shall we? Say you have a V.32bis modem with a raw throughput rate of 14400bps. You connect it to your ST at 19200bps, and dial up another computer that also has a DTE rate of 19200bps. Now, when you download a plain text file, because of the wonder of V.42bis it arrives at an effective speed of 19200bps over the 14400bps link. Great.

Now - suppose you instead take that plain text file, and run compress on it at the remote site, and transfer without V.42bis. Now it only arrives at 14400bps, but given an average of 2:1 ratio for compress, your true throughput is 28800bps. I submit that on an ST limited to a DTE rate of 19200bps, you are better off manually compressing transferred data instead of relying on MNP5 or V.42bis. I'm somewhat undecided on the overhead for MNP4 or V.42 error correction, but my feeling right now is that those are both worthwhile, despite the error correction in Zmodem and such. (Mainly because they are active all the time, not just during a file transfer, so they prevent line noise garbage from spewing all over whatever you're trying to read at the time. This was an all-too-common occurrence with my non-MNP V.32 modem...)
>
>> My advice is to just install the new serial fix program, (the one

>(XYZ 2.01 and Uniterm) but I've never noticed :-)

Uniterm definitely does allow you to reset the buffer in one of its buffer menus; I forgot what the default size is but I have mine set at 8K right now. I think the default is around 1K...

It occurs to me that my troubles with the 38K speed before (on my Mega ST with Turbo16) were caused by the 200 Hz Timer A interrupt, which is a higher priority than the RS232 interrupts. If one were merely to rewrite the RS232 transmit and receive interrupt routines to bump the IPL at entry, the "noise" problem would probably go away, at the expense of maintaining accurate system clock values. Hm, I'll have to try this sometime.

495. 3DCalc from Microdeal

Newsgroup: comp.sys.atari.st
Date: 1992-07-14 08:12:52 UTC
From: pjc@jet.uk
Message-ID: <1992Jul14.081252.16831@jet.uk>
Source record: 219802

I picked up a copy of 3DCALC, a "3 dimensional" spreadsheet for the ST at the Wembley 16-bit computer fair this weekend. When I installed it on the hard disc and let rip I was massively underimpressed. It bombed the system when I opened a sheet, it bombed when I selected a menu option, [even, one time , the "about 3dcalc" title page.] The mouse and menu handling is very shaky, and after a few menu selections it gets out of sync, ignoring subsequent selections, like EXIT. Time to reboot. Who needs this sort of thing from a commercial product?

Straining to be fair, 3dcalc comes in 2 flavours, the junior-3dcalc version that runs in 512 k, and the grown up version that requires at least a Mbyte. Junior seems a bit more robust, but it still screws up the menu handling. I suppose that with a couple of disc accessories and boot programs , the 1MByte on my old TOS 1.0 st may be marginal for the spreadsheet. Or maybe it needs a newer TOS. On the other hand all the professional software I have seen runs just fine on the old museum piece.. It looks as this might have been a useful application, if it had been debugged before release.

Does anyone have any experience of this product, published by Microdeal in the UK. (It seems to have a German author, judging from the title dialogue - when I finally succeeded in displaying it)

> ... LAN built in? What does that mean? Appletalk? Built in ethernet? ...

I don't think it means a whole hell of a lot. The TT and then the Mega STE had LAN ports and to my knowledge there is NO|NIL|ZERO|ZILCH|NADA software that will network Atari's together let alone to other machines. <BTW don't waste my time mentioning MIDI or RS232 networks.> This is total crap! I have two Atari machines one 1986 and one 1992 and if they were both Mac's then they could be networked.

I wish Atari would just drop this home/leisure computing bit and get serious. When these Falcon things do go on sale they should come with similar bundled support software as Mac's and that should include networking as standard.

Since the network hardware in the existing Atari machines (and presumably the Falcon too) is the same as that used in Mac's I think Atari should make a deal with Sun for a version of TOPS.

498. Atari Falcon Review wanted

Newsgroup: comp.sys.atari.st
Date: 1992-07-14 09:04:58 UTC
From: matthews@miranda.co.uk
Message-ID: <1992Jul14.090458.17599@meiko.com>
Source record: 219805

I have just started reading this news group to try and find some information
on the Atari Falcon (not being much of an Atari buff!)
I caught the tail end of the 'Hands on Review', and would much like to read the
review itself!
Please could somebody mail the review to me (the address should be above).

Thanks in advance.

By the way, I am thinking of moving over to the Atari for use as a sequencing
machine (having used an Amiga with MusicX and hated it!!). What I would like to
know is which of the Atari range you recommend (or use) and what software is best.

Mat

>there are no diffences in the memnonic to the 8031.
You're right.

>
>I'm sorry that I can't remember where I found the file,
>but ARCHIE should solve this problem.

You can find the Frankenstein cross assembler in our Atari archive.

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get 'as8051.zoo' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
File: /pub/ATARI-ST/lang/as8051.zoo

--> How to get 'as8051.zoo' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.
** PLEASE USE VALID DOMAIN ADDRESSES. DO NOT USE ADDRESSES **
** WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET **

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/lang/as8051.zoo
end

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service and/or the mail-server, feel free to drop me a line (by e-mail, please).

Ate Brink

500. TOS 2.06 Startup Delay Skip

Newsgroup: comp.sys.atari.st
Date: 1992-07-14 11:08:53 UTC
From: mario@rbiffm.informatik.uni-frankfurt.de
Message-ID: <3087@rbiffm.informatik.uni-frankfurt.de>
Source record: 219810

I have just installed TOS 2.06 on my old ST1040.

The startup delay to wait for the SCSI-disk to become ready has been done by the hdw3 bootsector, which tweaks the devices at the DMA bus with test-unit-ready commands.

The new TOS introduces a very long delay to wait for disks to become ready. With an additional utility named "NOROACH" the delay may be adjusted or skipped (also a bootsector).

As I am not satisfied with the adjustable wait solution of NOROACH I was planning to modify the hdw3 bootsector to turn off TOS 2.06 initial spin-up wait. Does anybody know what I have do at bootsector run time to change the time of the initial wait?

Perhaps there is a NOROACH source available somewhere?

501. Re: 38400 Baud -- Possible?

Newsgroup: comp.sys.atari.st
Date: 1992-07-14 12:02:52 UTC
From: hyc@hanauma.jpl.nasa.gov
Message-ID: <1992Jul14.120252.15537@elroy.jpl.nasa.gov>
Source record: 219812
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well, I dragged out my hacked up Zmodem to play with again between my Mega ST and my STe. I also had the HS_FIX program installed, with a patch I made to have the receive and transmit routines set the IPL mask all the way up. (As it turns out, this probably did nothing at all, since the RS232 interrupts are just about the highest level in the system already...) What I observed this time around was this: Set at 38400 baud, I got one or two garbage characters every 3 and a half seconds (thereabouts), like clockwork. WHen I dropped down to 19200, using the same high-speed mode, I got a garbage character every 7 or so seconds. Sensing a pattern, I stepped down to 9600, and counted up to 13 before I saw garbage. When last I posted on this topic many months ago, I chalked it up to some other clock interrupt and went on to other things. Now I'm not so sure; it's certainly very regular but it really doesn't seem to be related to any of the system timer interrupts. I thought perhaps it was related to the RS232 buffer size, maybe the overhead of wrapping around inside the circular buffer was killing it, but Zmodem uses a 16K RS232 buffer so that can't be the cause. Who knows, maybe it's a function of the number of bits or bytes sent, and I just noticed a particular time because my key-repeat rate worked out to that value. I guess I need to experiment a little more...

Anyway, the fact that it works at all convinces me that it should work all the time; the fact that it screws up once every N-sized-intervals tells me that something fixable is in the way, but who really knows, eh?

506. Re: pagestream upgrade

Newsgroup: comp.sys.atari.st
Date: 1992-07-14 12:44:32 UTC
From: nelson@that_machine.Kodak.COM
Message-ID: <3400@eastman.UUCP>
Source record: 219822

In PageStream, the printer drivers other than PostScript need large memory buffers to rasterize the output. Insufficient memory can cause the 2 bombs.

I suggest that you remove the spelling dictionary and all unused import/export modules from your configuration, (and extraneous desk accessories as well) to maximize the memory available to PageStream.

The 2.2b upgrade is a lot more solid about running in 1 meg machines but can still run into trouble when there's not enough memory to print.

Message-ID: <1992Jul14.144049.6043@a.cs.okstate.edu>
Source record: 219664

It's nice for arc and lharc.

Leave the .ttp fine in c:\util\
put your new files in c:\new\
open c:\util\
open c:\new\
keeping c:\new topped (this should happen if you follow directions... if it doesn't stay topped... maybe your right mousebutton isn't getting through to GEM...)

hold down the right button and then (double?) click on whatever.ttp in the \util\ directory. type a normal command pertaining to the files in the \new\ directory... such as
x newfile.arc
in the TTP dialogue. It will look in the "current directory" (c:\new\) for "newfile.arc" and also place all extracted files there...

Some programs have "setups" that let it know where to find certain files. (arc and lharc don't...) Application software frequently is setup to know
1) where to place newly created documents
2) where to find "modules" to itself
3) (apparently) to ignore what the system calls the current directory.

Flash (my editor of choice... also my telecomm software!) is good about retaining the current directory. I recall opening a window, finding a file to edit/browse and executing flash with that window (with the file to edit) topped. Then I do an "<ins> lo ca" and load the file by selecting it in the fileselector.

Trying out new versions of archivers however is my primary usage.
I seem to recall one of 'em (Won't name names!!!) creating archives in my c:\util directory. Peeved me a bit!!!!

jc

I would like to know about this as well, since I would love to get my hands on one of the later versions of PC-DITTO (I understand someone even made a patch to let it use the hard drive?). Unfortunately I can't find it anywhere.

If anyone has any advice, then please advise!

>Now there is no excuse to use Calamus (except that the Softlogic programmers
>still haven't worked out how to optimise screen-area redraws).

And except that Calamus has *always* been considerably faster (at EVERYTHING), considerably less crash prone (yes, I *have* used Pagestream 2.x, and it crashed a LOT), and had superior output on any device you can think of. Also, Calamus SL has features Pagestream can only dream of.

Pagestream is, however, quite nice itself, but more for hobyists than professionals. It has a different place in the market, and is quite good at what it does, but comparing it to Calamus is like comparing *Publish IT and Quark Express on the Mac... (no point really).

From: BWWL@IBM.RZ.TU-CLAUSTHAL.DE
Message-ID: <92196.16
Source record: 219828

I have just uploaded the file "stadconv.lzh" to atari.archive...

Contents of archive:
The archive contains assembler-sources to read compress STAD-pics and to
encode a 32k pic to STAD-format. The modules are designed to be used as
inline-code within other programs.
Demo-programs to show the method of using this modules are also included
(demos for GfA-Basic, C, Maxon-Pascal)...
The complete documented sources are also in the archive. Please read the
README-file to obtain further information.

Bye,
Wolfgang.

}> 400, 600XL, 800XL, 520ST
}
} -Mike

It is obvious from the above that my research was flakey. I have been using this feature lately to do things like copy or delete a file or check its size or date without taking the time first to top its directory, particularly when I intended to go right back to the previously topped one anyway. If I have done anything which would test to see if the topped directory were truly the default directory, I can't recall it. I primarily use WordWriter as my word processor, and it defaults to the directory you set in its config, no matter

what's topped, so that wouldn't indicate.

I'm STILL glad I learned about this, even if I CAN'T use it the way it's intended. Sorry about any confusion (including my own).

Does anyone know where the crt0.o, gcrt0.o, gcrt0+.0, etc. library files
are for gcc 2.1? I've ftp'd all the other files I need but I cannot
link anything. It keeps on complaining about not finding __split_mem
during the link phase. I copied some old versions of these libraries I
had lying about but things still didn't work right. Anyone know what
the problem is? (And yes, I have my environment variables set right)

Thanks,
Bill

>MNP5 or V.42bis.

I'd go further and say on most machines this is the case. Unless
the phone lines where you live are perfect. This was the whole point
of my note (maybe I didn't make it clear enough) The time taken to
run a text file through a compression program is much less than any
speed increase picked up by hacking your mfp, etc.

>I'm somewhat undecided on the overhead for MNP4 or V.42

>time.

Definately stay with error correction. At 9600, obne of the modems on
my feed occasionally connects without error correction. Meedess to say, the
results are garbage.

Never used it before, sorry.
>
>Ahhhh, btw, I thought I would slip in another question related to asm...
>what does pc relative mean, when is it used, why is it used and when
>do I have to use it? :)

PC-relative addressing means pretty much what it says. An address specified
this way is given as a 16 bit offset from the program counter, instead of as
a 32 bit absolute address. When is it used? Well, it can be used for the source
operand of many instructions. You are not allowed to use a PC-relative address
as the *destination*, though - this restriction is apparently to discourage you
from writing self-modifying code. As to *why* it is used - it saves 16 bits of
space vs. using a 32 bit address, which also means that the instruction can be
loaded and executed 4 cycles sooner than with a 32 bit address. Of course, in
a 16 bit offset, that means you can only use it to address instructions that
are within +32766/-32768 bytes of where you currently are. (Gee, wouldn't it
have been a cool optimization, on the 68K designer's part, to have made the
16 bit offset with an implied 0 bit? After all, you're only allowed to have
instructions on even addresses, so that low order bit is wasted in these guys.
If that 16 bits represented bits 1-17 instead, you'd get double the range, up
to +65534/-65536 bytes distance. Oh well...)

It's really not so mysterious, it's the exact same principle as used in the
various branch/branch to subroutine instructions. You write them as branching
to particular addresses, but they're coded as PC-relative offsets, i.e., the
difference between the address of the current instruction and the destination
address.

When do you *have* to use it? Never, really, but it pays in performance gains
if you choose to use it. You get the same gain from using the address-register
indirect modes...

Just a small real world note. I have used a powerbook networked to a cx.
ANY significant disk I/O (such as reading a small THINK/C project) makes
the cx unusable. So don't be over impressed with Appletalk. (That still
doesn't excuse Atari from not networking the machines.)

A better comparison would be to the UNIX workstation/ethernet market where
the networks are actually usable; reasonable bandwidth on the network and
reasonable response on the servers.

|> PC-Ditto II, I get extremely angry.

Who would like to fill me in on exactly what happened with Avante Garde?
I wasn't online at that time, so most of what I heard was word of mouth.

The PCDittoII boards did not work properly on all machines, if I recall.
So did Avante Garde file bancrupcy to avoid claims? Or what?

And is it really true that Bill Teal is in hiding? I.e. is he completely
inaccessible?

I think the gtar at atari.archive can do append. Tar in general can
I think. Though appending to _tapes_ is unsupported on every system
I've seen (including sun tape backups). Perhaps there is a way with
the newer drives...

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

All this talk about serial patches lately has left me with one question:

Which one do I use with TOS 1.0. I have tried all of them on atari.archive and none of them say they work with tos 1.0.

I have a US robotics hst 14400 baud modem and I lose characters all the time. Help!

--Bill

P.S. Interested in selling your TOS 1.4 cheaps for $25? E-mail me.

> selector anymore. I traced it down to some interference

I use the Harlekin file selector. Pagestream 2.2 works fine with that, though when I boot _without_ harlekin, Pagestream CAN'T FIND THE GEM SELECTOR!! The 'Open...' command always just opens an untitled window, and all other functions which call up the file selector return as if the 'Cancel' button was pushed.

Is anyone sure this is really not a downgrade? Or perhaps pagestream 2.2 is a July Fools joke...

Hmm.

>Thanks,
>Gerry
>ggreenbe@rodan.acs.syr.edu
>
Well, WriteNow3.0 does indeed work on Spectre. Thanks to those of you who responded, but nobody really came up with the correct answer.
When someone suggested that it might be a problem of the System/Finder version I was using, I checked the manual. Sure enough, WriteNow is made to be able to use fairly old systems...so I was alright here. But this gave me an idea to poke around my system folder. In the folder I found a file called "T/Maker Preferences", which made me suspicious. I decided to delete this file and let WriteNow generate a new one, if necessary. Once I deleted this file, v. 3 worked just fine. I guess these preferences were left around from an earlier version of WriteNow and were giving the newer version problems.
This is definately something to keep in mind when strange incompatibilities arise.

Is it possible to burn programs into an eprom for use with the
ST's cartridge port ?. I noticed that when you install a drive and use
the _lowercase_ C you get a 'cartridge' icon, which for most things
looks like a drive but you can't copy to (which is obvious) or from it..
.. I was wondering if it is possible to burn my most used programs into
it.

Has anyone had any luck running Apple's Diskcopy program with the Spectre GCR? I can't get the disk image files to transfer to a floppy disk. I have tried both Mac and Spectre disk formats. Either way, I get Mac error -17 anytime I try to transfer an image file to disk.

What is Mac error -17? Is it possible to run Diskcopy on the Spectre GCR?

I am using Diskcopy to create System and Utility disks for 6.0.7 that I obtained on ftp.apple.com. If Diskcopy isn't compatible with Spectre, is there some other place that the System disks are available in non-image file format? I've had no problems with running binhex, stuffit, etc. on Spectre, just Diskcopy.

Any help appreciated.

Get the file called MountImage from most Mac ftp site will slolve your problem if you don't have access to a real Mac or the Image files are the image of the 1.44MB disk.
The MountImage will read the image file and put it up on the desktop with a disk icon and you can copy files out of it just like it's physically mounted (it's cdev so just drop it in the system folder and reboot the system then choose the control panel to mount the image files. Oh, yes, it can mount more than 4 image files at a time.) And it works beautifully with GCR.

Have fun

I know this may sound rediculous, but would you trade the 80meg HD for a HighSpeed FAX/MODEM? I payed just about $200.00 more than you are asking for your HD, but I REALLY need a HD, and would be willing to sacrifice my Modem for one. This Modem is BRAND NEW... Like 6 days old today. It has a 5 year warranty along with over 60 in store days on that warranty. (90 day instore warranty). It has V.32bis V.32 V.42bis & V.42 along with MNP 2-5 & 10 (for cellular phones). It is Very small and runs at 14,400 (raw) and up to 57,600baud (throughput). The fax will operate at up to 14400 baud as well. (has SEND & RECEIVE). I really need a HD... I now have over 600 disks and need some way to organize my files...

Craig,

We are now releasing the Z*NET FNET (FoReM-NeT) into fido here in zone 3.
Ask one of your local fido nodes to ask there RC to poll 3:772/35 for the
news group Z*NET and you will read all the lasttestt news releases.

I will be polling for a new news group on usenet soon called
comp.bbs.znet. This will carry all the fnet for the Aari as well as
IBM/unix/etc. If we get it you will no have to go to Genie.

regards,

Jon Clarke (Z*NET FNET now in FIDO) HSBC NZM EBD

>Again, this is the 'right' kind of data - a file full of spaces, but gives
>something like 259:1

> Iain

Not to blame you, Iain, but i have tested V.42bis with a locked baud of
38400 and a 2400 baud connection and got on a (for sure not very reasonable)
file about 3600 cps... Thats aehm... about 10:1... so the claim that
v.42bis would only do 4:1 in BEST case is surely wrong.

I mean, it is correct to use any good compressionprogramm to transfer data
over the phoneline, and you also may use a bad compressor if it compresses
more than your max. locked baudrate divided by the connection speed would
give. Aehm.. better an example :)

Take a locked baud rate of 38400 and a connection speed of 14400.
Then you get a factor of 2.666 of the maximum achivable compression or
in other words, even if v.42bis would compress better, the modem can`t
send more data (i think i got it right now...:)

Now lets take a good compression programm, like lha or arj or pkzip
or whatever and pack normal textfiles to about 30% of their original
size. Then you will be faster in ANY case with the packed files than you
would be with V.42bis alone.

I mean, V.42bis is not a bad compressor at all. E.g. when i use it with
a plain HST where i get a V.42bis and 2400 baud connect my textoutput

nearly goes up to 9600... and thats nearly the 4:1 claimed by v.42bis.

Read ya, Phil

:indirect modes...

There are actually at least one time when you _almost_ are forced to use
PC-relative addressing - the bootsector. First of all, as Howard Chu
pointed out, it saves space (and space is something you don't have a lot
of in the bootsector :-). Secondly the OS doesn't relocate the boot-
sector (and how could it? there's no relocation-table ;-) when it loads
it into memory.

(Mark Hughes) writes:
> Okay, here's a few questions: Has the GW been released yet?

Sorry. Not yet.

> If so, where can I get it?

When available you'll get it mail order from Double Click Software and
presumably from all 'good computer stores/shops'. Never in a million years
will it appear on ST Format's cover disk.

> How much?

Dunno. This is up to Mike Vederman at Double Click.

> If not, when?

It was supposed to be out last December but Mike says this September now and
will also be demonstrating GW at Dusseldorf.

The delay has improved GW though by magnitudes. It was good then it's aweseome
now IMHO.

> Why not?

Manuals. Mike is writing the manuals and there's a LOT to document.
(and we keep changing things :-)

>Which versions of Sozobon will it work with (will it work with other
>compilers?)

Game Workbench was developed using Sozobon 1.2 with a modified linker to
support big libraries. Currently it works with Sozobon 2.0, MWC, Laser and
I think Lattice C. It should work with any DRI compatible compiler that can
handle a big library. At the moment HSC can't. We could slice up the library
but that makes things a bit more complictated.

BTW> Supporting various compilers in the ST market is a MEGA headache.
They all have different object file formats and register usage.
Even the ones that claim DRI support are not truly compatible.
eg. Laser C uses A2 as a register variable.

Since Sozobon is PD I guess it can be included in the box for instant usage.

> I could seriously use the GW Real Soon Now.

I really wish you could have it Right Now but it's out of my hands.
But for now, thank you for your interest and I hope you'll enjoy it when it
is available.

Hi All,
I'm looking to buy a printer for my ST and I think I've narrowed the choice down to two, the Canon BJ-10 and the Citizen PN48. Does anyone out there have either of these connected to their ST ? Are you happy with it ? I'm really looking for someone to comment on the print quality of the Citizen and the printer driver compatibility of the Canon. If you have either of these printers running with your ST could you let me know your opinion of it and whether you would recommend buying it.

Thanks.

556. Pagestream vs Calamus SL

Newsgroup: comp.sys.atari.st
Date: 1992-07-15 12:14:31 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <15JUL92.08143158@cc4.crl.aecl.ca>
Source record: 219666

I have both Pagestream 2 and Calamus SL. Yes, Calamus is more powerful but the learning process is arduous (to be polite). While some may say that Pagestream is for the hobbyist, I can crank out great DTP work in minutes compared with hours for Calamus SL.

However, I am struggling to tackle SL; hell I have invested megabucks into it so I'll give it my best shot. One day I will feel comfortable using it or I'll use the manual as a monitor stand.

For those who bad mouth Pagestream; at least the product is user friendly!

557. Re: ST cartridges?

Does anyone know any well stocked sources of cartridges for the atari st computer in the UK? Also, does anyone know if cartridges are compatible with both the old ST and the new STe machines (planning to upgrade from an STFM to a 1040STe in the near future).

Thanks in advance

John

It also does that with DST set. One of my m/c's runs GMT0BST & the +64 bug hit as soon as the hour was added. Still it wouldn't stop me using zoo. My Unix version of lharc insists on writing files owned by root which causes me to curse everytime I'm forced to unpack an archive with it. --- Yes I could go find the bug but I haven't the time !!!

Apparently so - there was an article in the old Antic Magazine ST section about just such an endeavor. I'll type it up if it's not too long and if it doesn't have a ton of pictures... Although I must agree that a Spectre is pretty spiffy to put in the cartridge slot. I prefer ST-ware, usually, but I like playing Dark Castle... |-)

560. Calamus font trouble

Newsgroup: comp.sys.atari.st
Date: 1992-07-15 13:10:52 UTC
From: kris@tpki.toppoint.de
Message-ID: <1992Jul15.131052.6242@tpki.toppoint.de>
Source record: 219685
Cross-posted to: gate.maus.atari,comp.sys.atari.st,comp.fonts

[This is a crosspost to gate.maus.atari,comp.sys.atari.st,comp.fonts
and therefore in english language]

My boss had an Atari Mega ST 4 with an old version of calamus
and many commercial fonts (900 DM all together, from different
vendors). The machine was recently upgraded to a TT and we also
upgraded to calamus SL.

Unfortunately the serial number of the SL version is different
from the old calamus, so I can no longer use the old fonts.
Also the old version of calamus does not longer work with the
TT. All in all I am unable to do my work.

I ran into an article about the calamus font format posted to
comp.fonts by

>From: jhelling@cs.ruu.nl (Jeroen Hellingman)
>Newsgroups: comp.fonts
>Subject: Calamus font format [long and in Dutch]
>Summary: An incomplete description of the calamus font format
>Keywords: calamus, font formats
>Message-ID: <1992May11.113649.11032@cs.ruu.nl>
>Date: 11 May 92 11:36:49 GMT

Jeroen explained the font format as far as he was able to
reverse engineer it. His descriptions were right and I was able
to locate the different sections of a .cfn file with his
descriptions.

The .cfn-File contains a variable length description of the
characters outline. All character outlines that make up the
font are assembled together to the form the outline section of
the font. This section is prefixed with an offset table, a
table of pointers relative to the beginning of the first
character in the font.

This offset table, consisting of 224 longwords, is the only
coded part of a calamus font file:

[... from Jeroens text ...]
6. Offset tabel (10B4)

CFN_offsets
word id 5
longword mask initieel masker voor decodering offsets
word size

longword[size] offset gecodeerd als CFN_header.serial != 0000

De offset is als volgt te decoderen:

```
offset[0] = offset[0] XOR mask + CFN_header.serial
while n < size
offset[n] = offset[n] XOR offset[n-1] + CFN_header.serial
endwhile
```

offset -2 == bestaat niet
[... end quote ...]

This is true for not encoded fonts. Unfortunately the given decoding scheme does not work for my fonts (type field is 1001 base ten).

I have mailed Jeroen and he said he also has sometimes trouble with the font protection of calamus. He has created some fonts himself, serial number set to zero, which calamus refuses to load. This also happened with another font he got from a third party vendor.

So my question: Do you have information about the calamus font format or even better, source for a converter program? I have some really urgent work here to do, which I am unable to finish without working fonts.

Thanks in advance,
Kristian

I don't buy this memory B.S. I was working with the exact same setup
with PageStream 2.1, and everything working perfectly. No bombs when
printing at all, ever! So why does upgrading cause this to fail?

BTW, how many drives are experiencing this problem? I know 2.1's
EPSONX is, because that's what I use. Someone posted problems with
the Deskjet drivers I believe. Anyone have problems with others?

>Hm, let's think about this a bit, shall we? Say you have a V.32bis modem with
>a raw throughput rate of 14400bps. You connect it to your ST at 19200bps, and
^^^^^^^^
>dial up another computer that also has a DTE rate of 19200bps. Now, when you
>download a plain text file, because of the wonder of V.42bis it arrives at an
>effective speed of 19200bps over the 14400bps link. Great.
^^^^^^^^^^^^^^^^^^^^^^^^^

You made a fault. You said, that the speed between the DTE and the modem is 19200 bps. Between the DTE and the modem the minimum you transfer is 8N1. That meens that every byte has 10 bits. On the phoneline between the modems we have to transfer 8 bits per byte, because of MNP4 and V.42. If I now also uses V.42bis the maximum effective speed between the modems is 15360 bps.

Message-ID: <1992Jul15.135537.20907@crc.ac.uk>
Source record: 219684

Hello,

I am trying to buy some software and hardware from somebody in America.
(BTW I am in England).
What is the best way to send the money and also what is the best way to
deliver the things I am trying to get.
The software shouldn't be a problem, I suppose just a jiffy bag or something
like that will do. What about something like a hard disk?
What can you do if for example something gets broken or lost in the post?
I would appreciate some detailed instructions as I have never done anything
like this before.

I realise this must be a frequently asked question.
I have heard several people saying "look at the FAQ". How do you do this??

Thanks a lot,

Phil
(E-mail naffara@uk.ac.crc)

|> Sun admin/support/programming phone: 0222 874000 x 5282 (UK)

I have a Canon BJ-10ex printer running on my ST, and I have no complaines about it. I use it mainly with Write-On (wordprocessor), Cubase (MIDI-sequencer), Revenge Document Displayer and to print out from desktop. I have had some problems with the printout quality in Cubase, but I think that is a problem with Cubase and not the printer.

NB!! You should be aware of the two different models of Canon BJ-10:

Canon BJ-10e (emulates IBM Proprinter)
Canon BJ-10ex (emulates Epson-LQ and IBM Proprinter)

The price is the same, the Canon BJ-10ex is just a newer model. I find the Epson emulation very useful, most software has support for Epson-LQ. And the printout quality is good. Somone might try to sell you the old Canon BJ-10e with a "new" price.

I am still not sure whether the IBM Proprinter and/or Epson-LQ emulation takes full advantage of the capabilities of the printer. I have never found a Canon BJ-10 printer driver, so I haven't been able to compare. If anyone knows more about this, please make a comment!

- Oddvar Tveito (otv@nta.no)

:EMILY:
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of
humor.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways),
Emily has taken time out of her busy schedule to answer a few commonly
asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.
Flame wars are fun. They're the main reason people creted Usenet,

and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV:
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5
Invalid handle.....-37.....6
Insufficient memory.....-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46.....15

```
No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

What is Free-Net and how can I get access?
=========================================

A "Remodeled" Atari S.I.G. Opens
```

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

--

Mark Leair
Atari SIG Public Relations

:MAGS:
What magazines are available for the Atari ST?
==========

The information here is preliminary. If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.
As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> for some info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

There are ST sections in New Computer Express (weekly) (this magazine ceased publication in February 1992), Computer Shopper (monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2, D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

:TIPS:
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET:
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR:
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.129]

cs.uni-sb.de [134.96.7.254]

archive.cs.ruu.nl [131.211.80.5]

:COMP:
Atari-related companies
=======================

This is a (still under construction) list of companies and addresses that might be of use to Atari ST users. Please send me addresses for the blank ones on this list. See also IAAD, it lists many more companies that are not on this list.

BMS

GengTec

JRI

Marvin AG

Matrix Datensystem

Supra

TKR

Wittich Computer

Archive-name: csas-faq/part2

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

WEL Welcome to comp.sys.atari.st
*ARCS How do I deal with Archived files (.ZOO, .ARC, .LZH)?
CLI What Command Line Interpreters are available?
ERR What does TOS ERROR nn mean?
GDOS What is GDOS, and where can I get it?
*GNU What GNU software is available for the ST?
HAM Where can I find Ham Radio software for the ST?
LANG Public Domain/Shareware languages...
MINIX Is MINIX available on the Atari ST?
MINT What is MiNT?
DEMOS Why won't demo x run on my machine?
PAINT What is the format for [x] paint program data?
PD Where can I get Public Domain/Shareware software?
*MAIL E-Mail file servers
*FTP Anonymous FTP servers
*TEX Is TeX/LaTeX available on the Atari ST?

:WEL:
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
```

comp.sources.atari.st ! uuencoded/shar sources

:ARCS:
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using zoo21.ttp.

:CLI:
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell - available under MINT

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4

```
Bad request.....................-5
Seek error......................-6
Unknown media...................-7
Sector not found................-8
No paper........................-9

Trap Instruction Vectors.....32-47
[unassigned, reserved].......48-63
User Interrupt Vectors......64-255
```

:GDOS:
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

:GNU:
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2.5 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at cs.uni-sb.de and most other European FTP sites. The latest version of GCC available for the ST is 2.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM:
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)

Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG:
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
ICON
LISP
Modula2
OPS5
perl
PROLOG
SCHEME
Smalltalk
XLisp
XProlog

XScheme

Check the atari.archive server under /atari/languages. Most other archive
sites will have a language directory which you can also check.

:MINIX:
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386,
and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and
later in 1991, Sun SPARC. It is available with all the source code for
the entire operating system, the libraries, and nearly 200 UNIX-like
utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free
via anonymous FTP for people on the Internet. A Macintosh version will be
online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to
ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME
file describes the contents of the directory and how to use it. Be sure to
fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-
Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T
ask me to send it by email. I have quite enough work already thank you.
The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line,
MINIX itself is copyrighted software and is not available on line. The
demo disks are also copyrighted, but permission is hereby granted to
upload and use them for evaluation purposes. The READ_ME file tells how
MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT:
What is MiNT?
==========
MiNT is a free multitasking operating system extension for TOS. It is somewhat
like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM
program along with a lot of character-based programs simultaneously. MGR

and MW2 can both put multiple terminal windows on screen, and bgacc can put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:DEMOS:
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from atari.archive to allow this.

:PAINT:
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@twitterpater.eng.sun.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access

via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

```
begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end
```

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
----

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.129]

cs.uni-sb.de [134.96.7.254]

archive.cs.ruu.nl [131.211.80.5]

:TEX:
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty

The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program
that takes care of the details for you.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ACCEL:

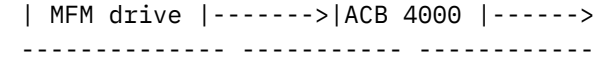
:DRIVES:
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:



3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup

SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again. And check the jumper setting on the drive (consult the drive's manual). If you are using more than one drive with the system, make sure only the last drive has the terminator (either a DIP or a signle inline package of resistor, which usually is socketed and close to the SCSI connector on the drive circle board. Remove the terminator from other drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5 from ftp sites.

:FLOPPY:
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe and TT machines. If you own an older Atari ST, there is a company which offers a $199 kit (including floppy) to install and use the drive. (I will supply the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the desktop.

:GRAPHIC:
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass at listing some of them. The information is based on postings by Ben Gilbert and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different graphics boards available, from hobbyist to professional, from CAD to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY:
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM:
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

:MONITOR:
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150,

used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM:
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE:
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases. The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE:
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

Randy,
I'm using my ST for this. I use the X-10 box that also works on IBM's
and a program from Michtron called ECHO. Works great! DAK had the best prices
on the hardware, but they're supposed to be Chapter 11, so good luck!
Bill

>my time mentioning MIDI or RS232 networks.>

Ok, can I waste your time mentioning Universal Network? This uses the TT and
Mega STe LAN ports, as well as providing for connections to older ST's without
LAN ports. There is also another piece of network software, I think it's called
Lantastic, but I'm unsure of the specifics of this program. Anyone care to
comment?

Oh, by the way, Universal Network is produced by the same people who make
Universal Item Selector III. You can't say that it's not supported!

574. ST software in a PC...?

Newsgroup: comp.sys.atari.st
Date: 1992-07-15 16:54:56 UTC
From: ganderso@unlinfo.unl.edu
Message-ID: <1992Jul15.165456.24359@unlinfo.unl.edu>
Source record: 219687

I just heard of an outfit called Branch Always Software in Bellevue, WA (USA), who have released an ATARI-ST emulator for the PC!

Anyone know anything about this? Is it hardware or software? And does it actually work?

Any information -- including a phone # for Branch Always (directory assistance couldn't find them) -- would be warmly welcomed.

And what if you're doing a byte length operation? After all,

lea 13(PC), a0
lea 21(PC), a1
move.b (a0)+, (a1)+

is a vaild operation. If the designers had used an implied bit 0,
you couldn't use PC-relative addressing to find the terminating
null byte in an arbitrary length string (for example).

576. Mega STE and other ST stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1992-07-15 17:14:32 UTC
From: ekrimen@wet.UUCP
Message-ID: <4124@wet.UUCP>
Source record: 219696

```
FOR SALE --

Mega STE (4meg RAM, 50meg HD, 1.44meg floppy, TOS 2.06, FPU) -- $1000
Excellent condition, clean; comes with all manuals and original
packaging

Supra 2400 modem -- $80
Excellent condition, clean; comes with all manuals, power
supply, phone cord, and original packaging.
with modem cable and 9-pin adapter for MSTE/TT -- $90

Calamus 1.09 and Font Editor 1.0 -- $100

Omnimon Peripherals Omnix3 multisync monitor switchbox -- $70
Fine condition. Still has 6 months left on warranty.
All solid-state operation; no mechanical parts.
Mega STE must be sold before this is.

Epson 720K floppy drive pulled from Mega STE -- $60

Three flip-top disk cases: 2 can hold 80-90 disks and have locks
-- All for $20 1 can hold 40-50 disks

I'll sell everything listed above for a total of $1200. UPS Ground
shipping included on everything but disk cases (unless sold as a
package deal of course). Will entertain other offers and package
deals. Please leave e-mail to ekrimen@wet.com or call 415-751-3693.

577. ++-- ATARI COMPUTER FOR SALE --++

Newsgroup: comp.sys.atari.st
Date: 1992-07-15 18:03:05 UTC
From: richardson@vaxr.sscl.uwo.ca
Message-ID: <1992Jul15.140305.1@vaxr.sscl.uwo.ca>
Source record: 219688

I have the following computer for sale: NOTE THE RAM UPGRADE *TYPE*

520ST w/external floppy drive (TOS 1.0; 1986 machine)

*** upgraded to 2.5 meg with a SIMMS conversion
eg. the memory can be upgraded to 4 meg in a matter of MINUTES
by simply adding more SIMMS

- the machine itself is old but VERY reliable; the new upgrade gives it
a great new lease of life.

- check ST Format for prices on this upgrade (Evesham Micros) it's not
a cheap one!!! It of course has 2meg on board!

I want to upgrade to a mega but I need some capital, make a decent offer and
the computer, upgrade, MANY disks of PD software and a games could be
yours (i'll throw in RESOLUTION 101 and SIM CITY free: a great 3D vector
graphics game and the classic city simulator -- both with all original
packaging etc.)

PLEASE E-MAIL AT BELOW OR CALL NUMBER BELOW (**AFTER 5PM EST.**)

>Kym

Yes, it is. I have a friend that has written a program that converts your
favourite files to a binary file that you burn into eprom. You can have
auto-programms if you want too.. I'll see if I can persuade him to let go
of the program.. :)

One one the main problems though is that cartridge only can store about
64KB...

Jeff,

Does Stalker hang up when you quit the program? If not, then why
don't you try connecting to a bbs and have them send something with zmodem.
Then quit Stalker and try XYZ - that seems to be (from the posting so far)
the fastest and most capable zmodem transfer program so far. Hopefully,
whoever wrote XYZ will fix that bug that someone else mentioned (I think
it was sending multiple files, or perhaps sending directories.

Let us know how it goes. (oh, if it is a multi-line BBs, try it when
there is a low number of people on - the load may affect your throughput.

Source record: 219697

Each to his own, of course, but I caution everyone to examine the benchmarks used for NVDI v-e-r-y carefully. I'm not saying it is not a worthwhile package as I think it is, but IMHO, some of the benchmarks are suspect; especially those that perform operations which are not at all typical of everyday use. When you combine those "unusual" operations with the others and derive an overall factor, it is easy to sway the statistical results (to be "faster" than Warp 9, for example).

Warp 9 or NVDI? I'd say either one is a winner but no one should need both!

Like a wise man once said though, "you pays yer money and you takes yer choice".

Very un-scientific, but have you made sure that there are no large MAGNETS around your monitor? My teenaged son put monster car speakers under his TV and made some very interesting effects similar to what you describe. I had a similar problem when I put a VCR under a 30 inch TV. The TV's magnetic field fed into the VCR, screwing up the recordings.

There are adjustments that can be made to your monitor inside. Vertical size might be a place to start, BUT WATCH OUT FOR _VERY_HIGH_ VOLTAGE.

Yup, there was the Audi 5000 fuel control system. It wrecked the whole
automobile by accelerating without warning ;^)

Seriosly, there was an Apple BBS package that would loop on disk reads,
thus adding years of wear in a very short time.

>I like playing Dark Castle... |-)

Hey, Dark Castle for the ST is in *color*, what are you going loading Spectre to play the Mac version for? Geeze.... }-)

The cartridge can be up to 128K of ROM space. It only acts like a "drive" on the desktop; I don't know of any command shells (like Gulam) that know how to access it, which is kind of unfortunate.

Personally I prefer my Alpha Systems Ultradisk, but it appears that Alpha Systems has left the business; they certainly stopped making Ultradisks. Too bad, these things are Really Excellent. (4 MB of battery-backed RAM, configurable as RAMdisk and print spool.) You get all the benefit of burning your favorite programs into a 128K ROM, but 32 times more space and much much more convenience. (You can configure the RAMdisk to be bootable as well, just like a bootable cartridge.) I think this is by far the most excellent thing to plug into an ST cartridge port....

>out there who knows what's going on or who can forward these problems
>to Soft-Logik, please help us out!

>Joe

Joe,

The first and best thing to try is to run your PageStream on a "clean" ST, in order to rule out the influence of accessories, auto folder programs, and NeoDesk itself.

If the print effort still fails, look in the back of your PageStream QuickStart Manual under TroubleShooting. This is the thin paperbound booklet that came with your program, not the user manual.

If you didn't find the reason in there, call the Soft-Logik tech-support line at (314) 894-0431. Note: They accept registered users only.

Hope this helps.

>anyone out there have either of these connected to their ST ?

I have a BJ-10ex with a bin-feeder (extra $90 here), and it is excellent. The BJ10e driver for Pagestream 2.2 uses the absolute maximum amount of the page - 5mm from each edge except one, 14mm. The Calamus driver had a small bug in it (you had to initialise the graphics printing yourself), but the Calamus SL driver works very well (although I think it skipped every second page (which is no big deal with a binfeeder, you just have to put the paper back through later) - I didn't use it much). The bin-feeder is REALLY worth the extra few currency units.

I have printed from PageStream with the Epson-LQ mode, and it is half-quality.
(360x180 dpi rather than 360x360 [though remember that the dots are larger
than a laser printer so a comparison there is more difficult]). Of course,
this is only for graphics - the BJ10 still uses its internal 360x360dpi fonts
when running in Epson-LQ mode (except maybe if you redefine the character set).

Subject: CX80 Trak-Ball to ST mouse conversion!
Reply-To: gpinzone@george.poly.edu
Date: Wed Feb 27 02:12:30 1991

Thanks to the support of:

Jason Sodergren soderg@wsu-end.eng.wayne.edu
Scott R. Chilcote vrdxhq!scotty@uunet.UU.NET

I was able to convert the CX80 style trackball to work as a mouse!

This particular brand is different in appearence to the 2600 trackball.
This one has a black roller, it's smaller and has two big triangular
buttons on each side (alot nicer than the 2600's). The instruction
manual comes in EIGHT different languages including Japanese and Arabic!

I have not figured on how to keep the "trak-ball as a joystick" intact
with this modification as was done with the 2600. If anyone can figure
this out, PLEASE let us all know.

I'm not responsible if you ruin your computer or get hurt or killed doing
this. You have been warned! :-) Seriously, don't attempt this if you don't
have a soldering iron and are not good at soldering (or de-soldering)
since you could burn out a chip. Also, be careful about static electricity.
If you have an Amiga, I've heard stories of damaging the computer by
removing the mouse while the power is on. I have no idea if this is true,
however, this device uses the +5V pin on your joystick port. Don't short it
out!

I used a logic probe set to pulse mode and searched for the elusive pulse trains. They appear in alot of different places. However, you can only use the ones obtained from one of the ICs in the circut.

You will notice that this model is not as easy to take apart as the 2600. Everything is compact and soldered tightly. As an electrical engineering student, it broke my heart having to use tape and loose wires to secure the nessasary electrical connections, but it really is the easiest way as long as you don't plan on opening it back up for any reason. :-)

To open it, pry off the little black rubber feet on the bottom of the case. It will reveal 4 screws. Take the screws out and remove the cover. There isn't anything other than the screws holding the trackball together (unlike the 2600 which has to be pryed apart). The chip you need is the 14 pin IC on the bottom right towards you (the joystick pins are at the top center of the unit). Note that the circut board is upside down (the components are underneath).

Here is a bad diagram of the chip on the ckt board :-)
Pin 1 should be labeled on the ckt board:

```
RED BROWN
| |
| |
1 2 3 4 5 6 7
---------------------------
| |
| |
| |
| |
---------------------------
14 13 12 11 10 9 8
^ ^
| |
ORANGE YELLOW
```

Disconnect the first four joystick connectors (Yellow, Orange, Red, Brown). Leave the rest intact. Push the connectors off, don't pull on the wires.

What I did was get 4 pieces of very thin bell wire, heat up the pin I needed with a soldering iron, and stick one end of the wire into the same hole occupied by that pin. Do this for all four pins (2,4,10,12). Make sure the wires are long enough to reach the joystick connectors.

Now that you have 4 leads hanging out of the IC, just wrap the correct lead around its corresponding joystick wire and insulate with scotch tape. Don't worry, I haven't been shocked yet by using mere scotch tape instead of UL approved "electrical tape" in any joystick application. These are very low currents and voltages....don't worry.....unless you have an Amiga ;-)

Stuff all this along the right side and underneath of the ckt board GENTLY! Test it out before you close it all up. Check to see the wires aren't in the way of the roller. And please, don't get any of the wires crushed when

you are putting on the cover. When you got the cover back on, test it again while holding the cover in place as a final check. Put the screws back in and the little rubber feet and that's it!

If you want this for your Amiga, switch the Brown and Yellow wires around.

If you want a right and left button you will have to run a brand new joystick wire. Get a Radio Shack extention cord and cut off the end you don't need.

WARNING: any similarity between wire colors of the Radio Shack cord and Atari specifications are purely coincidental! Check EVERY pinout! I used a continuity tester (a bulb and a battery) to check which pin goes where. A straightened paperclip fits nicely into the pin acceptors.

Once you've done this, you will somehow have to isolate the right button. I don't remeber what it was like inside. You may have to scratch off part of the copper with a sharp knife. Then you can solder to the exposed copper leading to the right button. The ST doesn't really use the right button that much (it follows the Mac envionment prettly closely). However, Amiga users will find this a MUST.

Remember to make a strain relief so you don't accidentally rip out the cable. You can do this by wrapping electrical tape (so that's what it's for) around the joystick cable before and after it enters the trackball case. Leave a small gap in between the two so you can close the cover. Don't hesitate to use alot of tape to make a suitable strain relief.

Well, that's it. If you have any questions, please reply to me at the address listed in the signature....

Subject: Re: CX80 Trak-Ball conversion
Reply-To: gpinzone@george.poly.edu
Date: Thu Feb 28 11:19:02 1991

I took another look inside of the trakball and as far as making the right button of the tball work as the right button of the mouse is not as easy as the 2600 model. I didn't bother attempting it. However, there is a much easier and better way to get two button control.

Go to Radio Shack and buy their mini normally open momentary button switch. It's fairly small and can fit in the deep well underneath the regular

buttons. Mount it on the top of the base, not the cover. Put it on the slanty part of the case. This way you can use your left hand to control the buttons and you right to move the trackball (unless you are left handed, then you just put the button on the right side of the trackball). Then again, get fancy and put one on both sides.....Use your index finger for the button you just put in (right mouse) and your thumb for the triangular one (left mouse) already built into the track-ball.

here is a bad diagram of what I mean:

```
--------
mount '
here ' big triangular
' button
' here
'
|
|
```

BTW, remember that you have to get a brand new cable to use the right mouse button. (see previous instructions)

598. Atari monitor died

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 06:58:22 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Jul16.065822.9021@sactoh0.sac.ca.us>
Source record: 219716

No, you can not use IBM monochrome monitors, as they are TTL (digital) monitors, and Ataris have an analog output. CGA and EGA monitors are also digital, and as far as I've known, are also unusable.

You can use multican (not multisync) monitors as the VGA standard is analog. You will need an appropriate cable.

But that is out of the question, as these monitors can cost more than the Atari color monitor.

But there is a new Atari 14" monochrome monitor which is a dead ringer for 14" IBM monochromes. But after looking at them awhile, I prefer my SM124.

You might look into the Atari exchange program, where for an exchange fee, you send Atari your dead peripheral, and they will send you a new unit. They may be exchanging SM124s for the new SM147, but I think the SM124 is better.

>clock values. Hm, I'll have to try this sometime.
don't reivent the wheel, please. Something like this has already been done.
It's called RS232Enhancer and replaces some parts of the TOS serial-I/O routines.
It works perfect over here. Now just add RS-SPEED (a small hardware allowing
you to use 38400, 57600 and 115200 on a normal ST) and away we go, at least for
sending. Unfortunately, the ST is too slow for recieving at those high speeds,
but that's the reason we've got RTS/CTS ;-)
Speed greetings from Germany...
/s/

As a casual user of archivers: The only problem I had with ZOO was the compression of file trees containing file names with non-ascii characters in them. As I happen to have a German keyboard, I sometimes use umlaut characters in my filenames, which is perfectly legal in TOS. Is there any solution to that kind of problem?

BTW: I still prefer zoo to lharc, caused by problems in the past to get incompatible lharc archives unpacked.

Help!

I have a Megafile 30 which has been working perfectly for about two
years, but yesterday it died on me.
I was in the process of compressing the partitions whitch CHECDSK3
from Atari. It first reported that it was unable to read the BPB from
drive F, and after a reboot the same happened to drive D. The next
time I had to reboot, there were no drives ledt, and AHDI said NOT
BOOTLOADED.
I can reach the drive with HDX, but I don't really feel like
reformatting it. - I have a 15 meg Minix-partition on it which I
haven't been able to back up :-(

Has anybody experienced this before?

I guess I would be able to restore the BPB's, but it's kind of hard
when my computer doesn't recognise my disk..

Hi all !

I just downloaded cla_v1r1.zoo the digital circuit simulator
from sol.cs.ruu.nl, but have problems running the thing.
The file was correct, did uncompress without a hick, but the
simulator part of the program (cla_v1.prg) gives 3 bombs anytime I
start the thing

I am running on a Mega-1, Tos 1.4, and have tried it with and without
(AMC)Gdos loaded, and NO accessories at all. Iused the paths as in the
zoo archive to install the software.
(PS. I checked for virusses, seems ok ...)

Any clues would be very nice ...
THANKS!

Rudi van Drunen

>it.

The desktop does the handling for lower-case-"c" itself. This is
not included in GEMDOS, but I think it would be easy to write a
file system driver for MiNT to do the same.

I think the easiest thing would be to store your programs in the EPROM
as if it were a block device, then write a little disk driver that
copies the data from the cartridge to the main memory.

Pro: Very easy to write
Con: When you start a program from the cartridge, also the text segment
would have to be copied. The desktop routines support programs that
have their text segment in the ROM area.

OK, I have read the FAQ about Spectre/GCR, but there are still some questions I would like answered about it.

I am currently planning to save up for a Falcon as soon as they come out. My questions are simple.

1) will Spectre work with it and take advantage of the better processor (I am pretty sure it will)? and

2) will it be able to use colour? This is quite important. If the Falcon has a 640x480 65536 colour display then I would like to use it (this would make a mac equivalent to my freinds IIsi at least I believe).

Also - does hypercard work with it?

Cheers all

Dick

I recall that The german magazine C't has had some articles on how to make a EPROM cartridge yourself to be used as an EPROM disk. There was software with it. It was a small assembly routine that did the job.

I can look it up if you want me to.

609. Spectre GCR / Colour

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 12:02:16 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1992Jul16.120216.8430@aston.ac.uk>
Source record: 219725

Well, correct me if I'm wrong, but I know that there are at least
two sets of Mac ROMS out there - 128k and 512k versions. Spectre
uses the 128k ROMS, which implies to me that it wouldn't be able
to run the 512k ROMS, which I'm pretty sure are standard in the
IIsi etc.
I don't actually have Spectre, but I use Macs pretty extensively
as part of my course. I think expecting Spectre to emulate a
Mac II is wishful thinking. Of course, it'd be pretty nice...

>everything returned to normal. I've never had a problem like this with my
>old 520stm. Anybody know what this is ?

It seems to be in the STE. I have the same problem when I switch resolutions
(medium and low) while the Turbo ST Color accessory is active. I then simply
try again and again (getting even weirder shiftings with strange color FX)
until the screen is normal, and then disable Turbo ST.

I found the same problem when I was messing about with the scroll registers.
If you use my program STRETCH.PRG you will see that it horizontally scrolls
in 2-bit resolution. I couldn't make it work with 1-pixel resolution for then
it would give the same whifting trouble when you hit the left or right borders
of the virtual desktop...

Does anybody know what exactly it is that a program can do with the video
registers that causes this? It looks funny, a bit non-digital (greyscale)

Compo sell a BJ-10 specific driver to go with WRITE-ON (5 pounds in UK),
I don't know if it works with anything else though ('cept That's Write,
I expect).

Sam.

>automobile by accelerating without warning ;^)
>

The amount of press Audi got on this always amazed me. I guess because of the difficulty in finding the problem and it was a pretty dramatic flaw. BTW, GM had similar problems with a few of there models, I forget which ones.

Audi's problems were minor compared to other auto makers. Ford has (maybe its been solved) a problem with an automatic transmission. Seems they like to slip out of park into reverse and run over their owners. A far more frequent occurence than Audi's 'sudden acceleration'.

And then there is Pontiac's pyrotechnic Fiero! If left idling longer than 10 minutes there is a very good chance you'll be able to roast marshmellows! A few hundred Fieros have gone up in smoke.

Anyway, enough car talk and back to the ST world.

>There are adjustments that can be made to your monitor inside. Vertical
>size might be a place to start, BUT WATCH OUT FOR _VERY_HIGH_ VOLTAGE.

Nope, there's nothing near the monitor that hasn't been there for months...

I don't remember who suggested it, but I got a message a few days ago
recommending that I adjust the VLIN pot. Having dabbled with the guts of
my 1224 monitor a couple of times in the past, I gave it a shot...
I turned the pot clockwise as far as it would go, then counter-clockwise,
then back to where it was before I started. It seems to have helped,
so I figure maybe the pot was getting a little dirty, or just wasn't
happy with having been in the same position for so long.

If I find that my little fix isn't permanent, I'm not quite sure what
I'll do... At any rate, thanks for the suggestion, Daniel -- it is
appreciated!

616. Modifying NES lightgun for Atari 2600/7800 - need help

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 14:14:52 UTC
From: drudetb@infonode.ingr.com
Message-ID: <1992Jul16.141452.7547@infonode.ingr.com>
Source record: 219727
Cross-posted to: rec.games.video,comp.sys.atari.8bit,comp.sys.atari.st

Light guns for the NES are bountiful and cheap. Atari light guns on the other hand are harder to find and more expensive when you do find them. Does anyone have information on converting an NES light gun to an Atari 2600/7800/XEGS type? I think it should just be a matter of changing the connector from the NES style to a regular DB-9 female, and redirecting the wires to the proper pins. Unfortunately, I don't have wiring diagrams for either type of light gun.

Can anyone help me with this?

Thanks!

617. Building GNU Src Tree

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 14:15:41 UTC
From: malay@sae.com
Message-ID: <1992Jul16.141541.3991@sae.com>
Source record: 219732

I'm in the process of building a GNU source code tree and I have come across files that are not in the 8.3 format. Would it be feasible to create a Minix file system and build the source tree on it - then use mint and mfs to "mount" this file system under TOS?? I have built most of the source from the original GNU packages and then applied the Atari-specific patches. Has anybody built and maintained gcc (for example) under TOS?? What problems will I encounter (besides this file name problem)??

Bob Malay

618. Re: pagestream upgrade

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 15:34:57 UTC
From: chuck@cpg.trs.reuter.com
Message-ID: <3505@richsun.cpg.trs.reuter.com>
Source record: 219733

Well, I didn't test the upgrade much, but I had a different problem with it. A document that I created with Pagestream 2.1 did not display the fonts correctly when I tried it with the upgrade. I think maybe the heading was the only part that was correct. I suppose that it's possible that something was not configured correctly, but I couldn't find the problem.

619. PC to Atari ST file transfer

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 16:24:39 UTC
From: cboyd@irus.rri.uwo.ca
Message-ID: <1992Jul16.162439.12108@julian.uwo.ca>
Source record: 219734

I've not been able to keep up with the comp.sys.atari postings, and I
couldn't find this info. in the FAQ postings, so...

I need a fortran compiller for my Atari (520 now with 1024K, single
sided drive, built way back in '85). I have the f77.lzh, as well as the
necessary archive program file from atari.archive.umich.edu sitting on
a Sun 4. I can transfer the files to a PC, but there I run into trouble.

I know that there is some compatabilty between PC and Atari disk formats, but
I need to know if I should format the disk on my machine or the PC. Please
tell me what I need to do to get the file to my Atari. (If I should format
on the PC, what density should I use, etc.)

I hope that someone can help me with this problem. I lose my network
connection (permanently *sniff*) in two weeks. Thanks in advance.

>equivalent to my freinds IIsi at least I believe).

I don't think the color will work, (at least not until Mr. Small has time and
has enough demand to add the color quickdraw support, which is only presented
in newer Mac ROM). The Mac use Color quickdraw to drive its color stuffs and
that codes are not presented in the Mac Plus ROM (the one used in the Spectre
and GCR). So in short, not in awhile at least.

>
>Also - does hypercard work with it?

Yes, Hypercard works with Spectre, in fact most of Mac software works just fine
don't expect MIDI, color quickdraw, or stuffs require Mac II type machines to
work yet.

I don't have a solution. I checked the program before putting it in the archive and on my ST it ran fine. For checking programs I use a 260ST with TOS 1.4 and 2 MByte memory, no programs in the auto folder, and only one desk accessory (the rhocontrol control panel).

> -- Howard Chu @ Jet Propulsion Laboratory, Pasadena, CA

Howard: I think what you're witnessing is a slight variance between
the sending and receiving system's UART clocks. The reason that the
MFP's /0 mode is not recommended for async is that, in async, you
don't have a common clock signal between the sender and receiver. The
receiver detects bits by watching for transitions on the input signal,
and if your clock rate is the same as the bit rate, you'd better be
exactly in step or you'll eventually miss a transition. To illustrate:

Sample time: V V V V V V

_______ _______ _______
Signal: ___1___| 2 |___3___| 4 |___5___| 6 |___7___

Note how transition #5 gets missed, since the samples around it both
catch the input signal in a high state.

In /16 mode, the receiver can sample the line 16 times per bit (the
"sample" line would be full of "V"s in /8 mode) and will therefore not

miss a transition.

In /0 mode you'd also have problems if you wanted/needed to use 1.5 stop bits. 1.5 stop bits may sound impossible ("how can you send half a bit?"), but it simply means that the line is held in an "on" state for the time it takes to send 1.5 bits. In /16 mode, this means that an "on" condition that lasts for 24 samples is a start bit, so the UART begins shifting the input bits into its input register.

I suspect you'd see a similar situation (albeit with a slight change in the error interval) if you communicated with a different brand of machine.

Dr Affara writes:

>I am trying to buy some software and hardware from somebody in America.
>(BTW I am in England).
>What is the best way to send the money and also what is the best way to
>deliver the things I am trying to get.

It depends on what you are paying. If it was < 30$, then I would get the money in dollars (as few notes as possible), and stick it in a thick envelope. The cost of an international money order is not worth it at that level.

Above that level, I would want to pay by VISA - if these people don't take VISA, then they probably aren't stable enough to deal with (two exceptions I have made in the past: ordering GNU software from GNU foundation, and paying fees for workshops to educational establishments).

>What can you do if for example something gets broken or lost in the post?
>I would appreciate some detailed instructions as I have never done anything
>like this before.
You are in a similar situation to where that happens when you use mail order within this country. Two differences are that the US people are not covered by UK law (although that doesn't stop British mail order firms from ripping people off), and it will cost you more if you have to mail things back. Your VISA agreement may give some protection here, I'm not sure.

Good rule for any sort of mail order: only deal with people who have been around a while and seem to be pretty upright. If you know someone who has used them before, even better!

Cheers,

Chris Price

>comment?

>Oh, by the way, Universal Network is produced by the same people who make
>Universal Item Selector III. You can't say that it's not supported!

I could waste some more time mentioning networks using ethernet
and the DMA ports or the mega slot. I know there are at least two
German companies (PamsNet and BioData) that sell network adapters
for the ST/STe/TT, and their products will certainly available
for the Falcon too. We are about to install such a network here
at our place, and I know they are running fine at some
universities. I also recall that I saw ANS (Advanced Network
System) at some boot at the CeBIT this year. And it seems to me
that a group at the TU Wien (Vienna) posted that they have
developed some TCP/IP stuff for the ANS hardware some months ago
here in c.s.a.st.
All in all, it seems to me there's quite a bunch of Atari network
stuff available. But still, I agree a system using those LAN
ports may be less expensive than the systems I mentioned, and
therefore nice.

Source record: 219618

I'm having problems with Spectrum 512 and TOS 2.06 in my upgraded
1040 STE. Spectrum loads okay, the video is in sync, and I can
access all functions with the mouse. (So the hardware is not the problem.) But
any keypress bombs out the program.
Is Trio Engineering still in business? Is its author Boris Tsikanovsky still
alive? Is there hope of some patch to resolve the
keyboard problem?
I've been wondering if I could get ahold of the original ST's TOS on
disk it might be a quick fix to this one incompatible program.
Has anyone tried this with success? Spectrum is too important to
my use of the ST to give it up, I'd like to avoid having the ROMs
switched back to 1.6x. and giving up the Newdesk desktop.
(Please, no flaming on how naughty, irresponsible, and evil Spectrum
is as a program with all its foul, insideous manuevers it foists on
the video shifter chip!) Honestly, 512 color mode is the only thing
that makes the ST line half-viable as a graphics platform in the 90's.
.
Please if you have a solution, know the whereabouts of Boris, or have
a set of 1.6x ROM's - please contact me!

Hmm.. I think I'll go and try that on some of the stuff I normally send
around..

>Now lets take a good compression programm, like lha or arj or pkzip
>or whatever and pack normal textfiles to about 30% of their original
>size. Then you will be faster in ANY case with the packed files than you
>would be with V.42bis alone.

Of course this way is better, the problem I usually see is when you have
to logon somewhere, tell the system to archive your mail then download it.
Whether to arc the file or let V42bis/MNP 5 do it's job is then less clear
and is dependant on ho fasr the system can archive the file.

Alas, the official development system for the Lynx is based on an Amiga (2000, or 3000) platform plus additional support hardware, and software. No ST version of this (mainly because the lynx and Amiga were created by a few of the same people).

629. Dream Machine needs video!

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 18:37:56 UTC
From: skolodzieski@vaxc.stevens-tech.edu
Message-ID: <1992Jul16.133756.1@vaxc.stevens-tech.edu>
Source record: 219739
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hello,

I am finnaly approaching my dream machine status. I have the following:

1. circa 1986 1040st upgraded to 4 meg.
2. a Tower Power (german) Tower case and Seperate Keyboard.
3. A Tiny Turbo 030 (50MHz) with 8 additional meg of ram.
4. Virtual Memory manager for the 030 card.

All I need to put me over the edge is a good video card. A friend of mine has a Crazy Dots 8, and a Eizo 6500 21" (1660x1200) grey scale monitor, and It looks better than one could possibly imagine. Unfortuantly Crazy Dots is either MegaBus or VME.

Does anyone know of a good quality vide add on card for a plain 1040. Space is not a problem as I have the tower case!

P.S.

I promise that tomorrow the new port of Emacs 18.58 will be on a.a.a.e, I just need to polish the doc a bit more. By the way I will put it in the directory new/ with the name "1858b-d3.zoo".

cheers,
scott kolodzieski

If 'dest' is an address in the range from -128 to +127 bytes from the current PC, a short branch can be made.

jmp dest(PC) is a 4 byte instruction

bra.s dest is a 2 byte instruction.

Otherwise I think they are the same.

Can TOS 2.06 ROMs be plugged directly into a 1040STe?
I have heard that it is necessary to add a jumper
somewhere. The instructions don't mention this.

I asked Dave Small about this at the Pacific Northwest Atari Festival here a year or so ago, and he said something to the effect that life was too short to try and figure out the 512k ROMs. Unless he's chaged his mind, a colour Spectre seems pretty unlikely.

Source record: 219747

Patrick Haggood writes:
>
>Is there a Lynx development system for the Atari ST? If so, where
>do I go about getting one?

No, the Lynx development system requires the use of an Amiga,
preferably an A2000 or higher. (Why? The Lynx was developed
by Epyx and was bought by Atari late in the game. Switching
to an ST would be too much trouble I guess. And both the Lynx
and Amiga choose onscreen colors from a possible 4096.)

You can write to Atari Entertainment in Chicago if you are
still interested. Beware, you need $5,000 and your signature
on lots of non-dislosure agreements.

637. MOSAIC on A.A.

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 21:15:21 UTC
From: randyh@hpsad.sad.hp.com
Message-ID: <750128@hpsad.sad.hp.com>
Source record: 219636

Hello all,

I have just uploaded my port of the tile game MOSAIC (mosaic.arc) to the new directory on A.A. This is the first GEM program I've written and it was real fun. Hope you enjoy it!

Randy

a portion of mosaic.txt follows -

MOSAIC:
Mosaic is played with a set of 81 two-by-two tiles on a 24-by-24 playing area. The objective of the game is to place your tiles such that squares of the same pattern (color) are connected as much as possible.

For the purposes of scoring, similarly patterned squares are connected only if they share a side; touching diagonally on a corner doesn't count.

Each of the 81 tiles is composed of four patterned squares. No two tiles are the same, and each comes up once a game, in random order.

This ATARI ST version of mosaic will run in any ST resolution. It can also be run as either a program or an accessory by changing the extender to .PRG or .ACC.

639. GCR on TT (Summary)

Newsgroup: comp.sys.atari.st
Date: 1992-07-16 23:13:38 UTC
From: ens@ccu.umanitoba.ca
Message-ID: <1992Jul16.231338.24971@ccu.umanitoba.ca>
Source record: 219605
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Thanks to everyone that wrote with suggestions on getting my GCR working on my TT. The floppy drive still doesn't work with MAC disks but otherwise Spectre 3.0 is now working from a hard drive; I have to carry the GCR over to a 1040 to convert mac disks to spectre format and then use them on the TT. Hopefully Spectre 3.1 will be available soon to correct this.

Here are a few things I learned that might be useful to other people in similar situations:

1) Spectre does not have to pass the GCR floppy test to work on a TT. If you are booting from a working hard drive plugged into the ACSI port, it should boot up all right. This is true without the modification recommended by gadgets. I was in fact using a hard drive from the beginning but without success because of item 2 below.

2) Spectre does not work at all on a TT with more than 4 Mbytes ST RAM. I discovered this when I tried it on a different TT that had only 4 Mbyte and it worked; mine has 10 Mbytes. I have temporarily swapped memory boards since so I can use Spectre. Someone suggested I try to trick Spectre by replacing the value of the global that indicates the top-of-memory with the value of 4 Mbytes. This might work but I rec'd the suggestion after I swapped boards and haven't had a chance to try it yet.

3) Spectre 3 is not bothered by extra TT RAM, but it also does not benefit from it; I have 32 Mbytes and it works OK (apart from the floppy drive).

4) The recommended modification to the GCR to make it work with MAC floppies on a TT didn't make it make it work on mine. That may be because I have a 1.4 Mbyte floppy drive. As mentioned above, I use Spectre on a TT with a hard drive and Spectre-format floppies. Some people have had success with external 720K floppy drives. (Can anyone tell me how to convert an internal floppy drive from a now defunct 1040 to work as an external drive on my TT?)

5) After the recommended modification for TT use, my GCR did not initially work on a regular 1040. However, by shorting out the capacitor it could again be used on a 1040. (It also works on the TT with the capacitor shorted if MAC floppy disks are not used.)

And according to the Germans accross the pond, it should be pretty
soon: Does anyone know when A.D.M (or is it A.M.D.?) is? And can anyone (at
Atari) comment on when it will be announced/released in the ol' US? Will it
be at CES again?)

>1) will Spectre work with it and take advantage of the better processor (I am
>pretty sure it will)? and

Well, it probably won't be useable without an update (which I am sure
that Dave Small is working on even as we speak). Remember, even TT needed an
update.

>2) will it be able to use colour? This is quite important. If the Falcon has a
>640x480 65536 colour display then I would like to use it (this would make a mac
>equivalent to my freinds IIsi at least I believe).

Not likely. It might be possible to have colour if GBS ever decided
to use the new Mac Clone ROMs, but I don't know the technical feasibility. It
could be as bad as how the other poster described "Life is to short trying to
figure it out". Using GCR on the TT is roughly equivalent to the IIsi (speed
wise - actually closer to that of the IIci), but the Falcon will not perform
that well - remember, the si is a 20MHz '030 and the Falcon (supposedly) will
be a 16MHz '030 - that plus overhead for translation, older ROMS (and probably
less efficient code) - The only thing that might make it run at IIsi speeds
is the fact that it won't run System 7 software :).

Simple ROM carts are probably fully compatible. My RAMdisk cart doesn't work in my STe, only in my Mega. Apparently it doesn't get enough power out of the STe.

This is due to that if you switch resulotion or screenadress without waiting
for the VBL (VSYNC) the shifter sometimes does this. So it's nothing to worry
about. It's just the programmer that have made a 'shortcut' or haven't been
aware of the problem.

650. The new Multi-TOS ....

Newsgroup: comp.sys.atari.st
Date: 1992-07-17 03:55:01 UTC
From: baffoni@aludra.usc.edu
Message-ID: <l6ch4lINNjbp@aludra.usc.edu>
Source record: 219612

Hi y'all,

I was thinking the other day (now stop laughing!) about how we all pretty much have heard what the Falcon specs will be, and that since it will be 'announced' in Germany soon, it is not likely to change in any major way. However, we haven't heard much about MTOS other than it will enable MiNT to multitask GEM progs as it presently does TOS progs. However, is that _ALL_ it will provide?

Just on the off chance that 1) Someone from Atari will actually read this, 2) that they would not hit the 'k'ill button after seeing Falcon in the body, 3) That they _do_ give a hoot what is said on this board, here is a list of some features that _I_ would like to see in the new TOS alongside the ability to Mtask (and I am assuming it will be built from a 3/2.06 base).

{These are _not_ posted in order of importance}

1) I'd like to see more (perhaps dynamically resizable from .cpx) windows on the desktop.

2) More usuable colors for icons! Lets make the desktop at _least_ as good as what you seen in a piddly Windows desktop. Resolution should be limiting factor with max being 256colors if having as many colors as the resolution allows causes problems for structure.

3) A ram-based jump table for bios routines to facilitate (unavoidable) patches. As someone pointed out, it is ridiculous for so many programs to all fight over one or two interrupts.

4) Get rid of the 8.3 name limit. 24 chars, or if you wish to keep the .3 for compatibility reasons how about 21.3 structure?

5) Either get rid of the limitation on the number of unique icons usable, or increase the number of unique icons usable if eliminating the limit is impossible.

6) Software support for 2.88MB floppies (Last I heard, there isn't a greyed out option for 2.88), and the possibility of swapping a: from the floppy bay to a specified SCSI ID (such as for one of the new 20MB flopticals).

Anyway, that is what _I_ would like to see in MTOS. Does anyone else have anything they would like to add to the list (try and be reasonable - Cray compatibility and similar requests will be heartily laughed at)?

-Mike

Hmmm..., as far as I remeber, the german magazine C'T published a hardware
to extend the address space of the Rom-Port. They installed a 512K eprom
disk.

But I just can't remember the issue. Must be about two years ago :-). If
someone is interested in, I will look it up.

Mmm, yum, yum. Can you please give any more information on these products
eg. Who sells them, where, how much they cost and specs (like whether they
can talk to a Mac network).

Thanks in advance

Yo !

I'm also interested in fax software for Atari. What kind of stuff exists, and
how do you get it ? Any FTP'able ones ? Commercial products ?
Any info is welcome...thanks !

Pasi

Hi Derek,

I have a few questions:

1. Are you still working on the ST X-Former?
2. If so, what is the current release and what are some features?
3. How can I get the X-Former (newest version) along with cables?
4. Have you written any STe versions? Will it work on the STe?

Comments: Most software I have tried does not work. (2.14 and 2.10)
Does Warp 9 not work with GFA? What is it's latest release?
and does Warp 9 run slower than Quick ST? I tested it with
the supplied program and got lower rates.

659. Falcon price and poss. release date?

Newsgroup: comp.sys.atari.st
Date: 1992-07-17 09:11:59 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Jul17.091159.12291@crc.ac.uk>
Source record: 219620

Hello,
I have read quite a lot of "info" about the falcon. I have no idea what the specs will be but I do have an idea of the price and release date.
This is a reply to a letter in ST Review issue 3.

Well first of all I am surprised that you actually have to outline some of the reasons why the ST is superior to the Amiga games machine, although as someone who owns both machines you really are in a position to know.
As to the Falcon, well we've all seen Commodore's A600 which is retailing at 399 (english pounds) and next to the Falcon it's just a very poor games machine, and it (the Falcon) can even give consoles a run for their money. (must be good graphics!) Add to this the fact that you have a real computer with computing power, then for less than 600 (english pounds again) it
^^
represents fantastic value for money. It's not easy to take my word for it, but once you see the machine you'll believe a computer can really fly....

I hope this isn't something you already know but I thought I would post it anyway.

As to the release date (I forgot to write it down so this might be a bit out) It should be on show (or even for sale!) at a show in Dusseldorf? on August 12-15? (these numbers might be wrong but it's not far off. It's definitely in the middle of August)

Does anyone have any real info on the specs? (not just rumours or I would like to see ??? on it)

Thanks,

Phil

Just a quick question this time.
Is there any way to install a Canon BJ10ex on the desktop?
The menu only has dot matrix or daisy wheel printers on.
I need this because I would like to print out pictures from Neochrome and
this uses the printer installed on the desktop.
Can you get a separate driver for this?

Thanks for any help,

Phil
(E-mail naffara@uk.ac.crc)

If the Falcon sells for less than the 600, I will eat my boots (and then go buy one). $700, more likely $800 or $900 I can believe (and I'll save up for one), but 399 english pounds (likely to translate to $399 American dollars), I won't.

35 days and counting till Aug. 21st.

Wish I could be there...

Sorry, I'm not from atari but I think you won't mind me making some comments
on your suggestions.

> 1) I'd like to see more (perhaps dynamically resizable from .cpx)
>windows on the desktop.
On the CeBit fair you could see that there is no limit for the number of
windows. It depends on the memory you have, of course.

> 3) A ram-based jump table for bios routines to facilitate (unavoidable)
>patches. As someone pointed out, it is ridiculous for so many programs to all
>fight over one or two interrupts.
Hmm, what do you mean by "unavoidable pachtes"? Don't forget, that only
resident programs are allowed to change system vectors. If the are
programmed cleanly there are no major problems.

> 4) Get rid of the 8.3 name limit. 24 chars, or if you wish to keep the
>.3 for compatibility reasons how about 21.3 structure?
I think this would be _very_ bad for a lot of GEM programs. But don't forget
that MiNT supports file systems without name limits.

> 6) Software support for 2.88MB floppies (Last I heard, there isn't a
>greyed out option for 2.88), and the possibility of swapping a: from the
>floppy bay to a specified SCSI ID (such as for one of the new 20MB flopticals).I think
there is no reason why you shouldn't be able to write a floppy
driver that supports flopticals. In my opinion that is not ataris work.
BTW, the new AjAX floppy controller supports a clock rate of up to 32 MHz,
so there may be some hardware kits for 2.88 MB floppies in the future.

664. Monitors for ST

Newsgroup: comp.sys.atari.st
Date: 1992-07-17 10:43:03 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Jul17.104303.13322@crc.ac.uk>
Source record: 219626

More questions!

I am looking for a monitor to use with my STFM. I have heard of several but
I don't know what the differences are or which is best.
Philips CM8833 mkII
Atari sc1435 (colour and same tube + res as CM8833 mkII)
Atari sc1224
Atari sm124 (mono)
Atari sm144 (mono)

I am using a TV at the moment and in medium res is barely readable.
As I am starting to do some DTP work I need a screen I can read!
I won't mind a mono monitor too much (because they are cheaper!) but I
would prefer a colour monitor if possible. I could still use my TV for
things like games etc.

The sm144 is 14" screen while the sm124 is 12". However I have seen the
sm144 cheaper than the sm124. How come?

I will probably buy a new monitor unless someone has got one for sale in
England (preferably close to Cambridge).

Thanks for any help,

Phil
(E-mail naffara@uk.ac.crc)

>solution to that kind of problem?

According to the GEMDOS reference manual, german Umlauts are not allowed
in filenames. It's a bug in the AES that it allows to enter them.

Yes, but from what I have seen, computer prices in Britain are
significantly higher than the American price times the exchange
rate; a $1 to 1 pound ratio doesn't sound unreasonable. Maybe
you shouldn't be so gratuitously caustic and derisive in your posts.

From what I have seen of computer prices in Britain, they appear to be slightly more than half the number of pounds as dollars in the U.S. For example, when a 1040ST sold for about $400 in the U.S. it was about 239 pounds (if I remember correctly). So, if the Falcon sold for about 600 pounds, that would put it at about $1000 in the U.S. So don't go getting yourself all woeked up. The only reason you would have to eat your shorts over the Falcon would be if you were to confuse yourself again.

Jon Eggert

>translate to $399 American dollars), I won't.

I don't think you read the previous post correctly. He was talking English pounds. Even though English prices (with conversion added in) are usually high, a one-to-one price is _not_ likely. More like 1.4 or 1.5 than the 2(?) its at right now. so if it sells for #600 there, it will probably be around 1k here. Hopefully a little less :). Of course, that will just be the console (and probably keyboard/mouse) - not monitor, but since the TT's monitors are just VGA monitors, it will probably be able to use them (means less cost operating cost). Or you can get a 3rd party multisync. Remember, if you don't like the Falcon, just think of what it will do to the MSTe prices, if it is selling at what the MSTes are selling for.

674. Problems with Publisher 2

Newsgroup: comp.sys.atari.st
Date: 1992-07-17 16:52:21 UTC
From: wyant@eplrx7.es.duPont.com
Message-ID: <1992Jul17.165221.2064@eplrx7.es.duPont.com>
Source record: 219634

We have recently acquired Publisher 2 from Timeworks as an upgrade. This new version appears to have many more problems with it than the old. For example, Publisher 2 is the first application that I have encountered that interferes with DC DeskTop. Even after almost all the accessories are turn off and DC DeskTop is disabled (only UIS remains), Publisher 2 still hangs when importing Word Perfect files and occasionally on printing (to a dot-matrix printer). Our machine is a 1040ST with 4 MB of memory and an ICD ADSpeed accelerator.

Have other people encountered such problems? Have these problems been fixed? EMailed comments and suggestions are welcome!

I have a friend in India who wants to add a modem to his Atari 1040ST.
Are there any such modems? I know that USA telephony is a lot different
than that in Asia, so buying one here won't help.

Source record: 219645

I gotta sell this stuff!!! Erg...

SC1224 Color monitor, vintage 1985. $100 + shipping
520ST, TOS 1.0, 1 MB piggyback expansion, Tweety board. $100 + shipping
Atari DS Disk drive: $25 + shipping
Homebrew DS disk drive w/ Sony mechanism: $40 + shipping

Seikosha 300 CPS draft office printer. $125 + shipping

3.5in floppies - about 250, all containing software for the ST. $100 + ship

Handy Dandy Power Organizer for old style atari systems - everything plugs into it, and you can control the power for up to 6 itms individually. $10+ship

Mouse Master - Handy Dandy thing that allows 2 joysticks and a mouse attached at the same time. $10 + ship

Wico Trac-Mouse - COnverted WICO track ball to function as an upside down mouse. $20 + ship

Various WICO Joystics and parts, in various states of repair, $10 + ship

If you take everything, I may have a small siezure (Considering I paid $1000 for St, Mon, SS drive in 1985) and mail it all to you for $250 + shipping.

Email all questions to me. Everything negotiable.

Chris

678. Drive problem

Newsgroup: comp.sys.atari.st
Date: 1992-07-17 18:47:40 UTC
From: cchiang@sdcc13.ucsd.edu
Message-ID: <35793@sdcc12.ucsd.edu>
Source record: 219637

Hate to sound whiny and stupid but my internal drive head
broke loose about a year ago and I haven't fixed it yet. A new
drive mechanism from atari costs $199 (They might as well take the
shirt off my back while they're at it), or I could invest in a new
external drive for $139. I think it is rather silly to have to
shell out 60 to 70 percent of my computer's current worth (I've got
a 1040stfm dated since '88) for a new drive. Does anyone know a
cheaper alternative? If not, does anyone know how to rig up the
external drive into the internal drive socket? Any help would be
greatly appreciated. Thanks in advance.

679. Problems with unpacking files from GENIE

Newsgroup: comp.sys.atari.st
Date: 1992-07-17 19:10:27 UTC
From: wyant@eplrx7.es.duPont.com
Message-ID: <1992Jul17.191027.2191@eplrx7.es.duPont.com>
Source record: 219638

I have been having difficulty unarcing files obtained from GENIE and the Atari archiver on Internet. However, other files can easily be unarced. I am using a 1040ST with 4 MB of memory and an ICD ADSpeed accelerator. For GENIE, I use a US Robotics Dual Standard modem.

Recently, I downloaded a variety of demos and utilities from GENIE using Zmodem from Aladdin. Only the Pagestream upgrade could be successfully unARCed, and that unpacked very easily. All of the other files (game demos, odd utilities), archived as either ARC or LZH, failed with CRC errors. I was using the DC X_Plus archiver utility to unpack the files, which has worked well for me before. Most of the LZH files recommended using Quester's UnLZH (lh5) routine, but I am unable to unpack even that. I also tried disabling all of the accessories, including DC DeskTop, but excluding UIS. The files still could not be unpacked.

I also obtained several utilities from the Atari archive site over Internet, but have been unable to unarc these files as well. Even the unpacked executable files (e.g., lharc.ttp) fail to run properly.

Any suggestions as to what might be the source of this problem? The Pagestream upgrade was downloaded twice, once from GENIE and once from the Soft-Logik BBS, using Zmodem both times. Both copies of the upgrade files unpacked (unARCed) readily. Every other download attempt has left me with files that cannot be unpacked. While I have not checked for viruses, I don't think that they are very likely for so many diverse files and different archive sources.

Any EMail suggestions for actions to try will be appreciated.

I haven't got a DOS manual to hand, but if you check the format command,
there are switches to format single sided 360k. This works OK as I've
done it myself. You *must* use the PC to format, not the ST.

No. The Lynx development kit is an Amiga(!) There are 2 versions
both not cheap. The more expensive is a few thousand UK pounds
but has full hardware emulation of the Lynx to test code on.

Many (not all) $70 internal mechs for IBM compatables work fine.

I installed an ND-352 (toshiba) for an IBM with minor incompatability problems.
(Other choices may be simpler to install, as I had to disable disk change
detection via gluing down a switch in the drive...)

Electrically... most any IBM drive will work.

Logically... the write protect line MUST toggle when a non-write protected
disk is removed and reinserted for disk change detection to work with
tos 1.0.

(my only difficulty (overcome as above) with the toshiba)

If you are interest in any of the following items, please make a resonable
offer. DO NOT send over mail asking me how much I want for it.

The following are my stuff:
1 meg 520 STFM (possible drive doesn't work)
1 Atari SC1224 color monitor
Supra Hard Drive unit(with no hard drive, 30meg or 60meg harddrive meg)
1 extra Atari Mouse
IS Talk, Isgur Profolio, Atari ST Developer package, LOGO User's Guide

Other:
Panasonic RK-P440 four color Penwriter
4 colors, 9 sizes, 6500 character memory,
24 character LCD, 4 graph functions, uses battery or AC.

Panasonic PV-4160 4 head VCR
Brand new, still in the box. Have no idea why we got it for.

The following are Mr. Greene's stuff. He has no net access.
The price on the left are your offers (you know who you are.) I have your
addresses and will give them to Mr. Greene. He would like to call you first.
If you can give him a call at 718-833-0102.

$400 Mega4 ST (with color monitor)
1040 STFM (problem in formating double side disks??)
1 Atari SC1224 color monitor
$75 1 Atari SC124 mono monitor
$200 Megafile20
$400 Atari Laser Printer

20pd, Word Writer
75pd, TimeWork Publish + PageStream,

It best to send me e-mail (since I don't check the conference)

Rod MacDonald's Application and Design Software still supports Universal
Item Selector and Universal Network to the extent that it can. I doubt
it will be upgraded. It's still advertised heavily.

However, Chris Latham has indeed started his own company, PowerPoint,
and has joined DragonWare. FleXor and PowerNet will be marketed by
one of these companies.

SL really is awesome. I've only done simple stuff so far, but I can't wait to get into the heavy-duty stuff. The manual is excellent; one of the best I've seen. The Help messages (that are also in Calamus 1.09) have manual reference numbers in SL; so if you have a question, you can go straight to the chapter and page in the manual, without searching through the index.

Most of all, ISD's support on GEnie is unequalled. I've never seen anything like it. Nathan, Lou, and Mario are fantastic.

688. Turbo C v2.0 compatible graphics library

Newsgroup: comp.sys.atari.st
Date: 1992-07-18 00:01:36 UTC
From: hartlenk@newton.ccs.tuns.ca
Message-ID: <1992Jul18.000136.12354@newton.ccs.tuns.ca>
Source record: 219646

Hi everyone,

I've just uploaded the file graphx10.zoo to
atari.archive.umich.edu in the atari/new directory.

This file contains a Turbo C v2.0 compatible graphics
library for Lattice C and Sozobon C. This library allows to to
compile your Turbo C code that uses the graphics library, on your
ST. I wrote this library for my own use and thought others may be
interested. BTW, its FREEWARE.

I've tested it on Turbo C code and written numerous
testcases, everything seems okay. As we all know the programmer
is NOT the ideal person to test his own code, so any feedback on
problems and possible enhancements would be greatly appreciated.

For those familiar with Turbo C, you might be interested in
running the BGIDEMO.PRG included in the .zoo file. The original
Borland source file (BGIDEMO.C 45k) only required minimal changes
(because of Turbo C specific functions) to compile and run, it
took less than an hour!

I Hope others will find this library as useful as I do.

That's correct, but then you can't access it as 'c:' whithout an extra
device driver though...

Too bad that Atari limited the adress-space on the cartridgeport to 128KB.

According to Darek you only have to plug in the MAC-roms in the
Gemulatorboard that you put in your PC. You don't have the 'GCR' function
though; so you can r/w Mac-disks, but the Mac-emulation should work...

To communicate and transfer files between an ST and the Portfolio,
I suggest that you get XTERM.COM, a terminal program. I use an
accessory program on my ST, TRANSFER.ACC and TRANSFER.RSC, Transfer
1.2 and set the serial ports to 9600 bps.

XTERM.COM is available on the DOS Utilities card, and it is
available from various BBS, I believe.

Date: 1992-07-18 07:39:52 UTC
From: pkor@phoenix.oulu.fi
Message-ID: <1992Jul18.073952.6380@ousrvr.oulu.fi>
Source record: 219583

Well, does anybody know the phone number/snail mail address to Joppa Software ?
What's the name of this fax program we're talkin' about ? Price ?
Best place to get it ?

Thanks,
Pasi

Message-ID: <1992Jul18.105239.5011@cheshire.oxy.edu>
Source record: 219559

Hmm... pound must've gained a lot recently in value.. thought it was around 1.5 pounds to the dollar... regardless, at least from what I've heard from the Brits, a 399 pound Brit computer usually winds up costing us Americans $399.

Thom

699. Re: Falcon price and poss. release date?

Newsgroup: comp.sys.atari.st
Date: 1992-07-18 10:54:51 UTC
From: leavitt@cheshire.oxy.edu
Message-ID: <1992Jul18.105451.5122@cheshire.oxy.edu>
Source record: 219560

Hmm... one person agrees, on doesn't. The original posting put hte price of the falcon at less than 399 pounds... even using the 1.5 times ratio, that puts the falcon at less than $600.

Still enough to make me eat my boots.

Thom

700. TOS 2.06 & SPECTRUM 512

Date: 1992-07-18 12:40:52 UTC
From: hasse@solace.hsh.se
Message-ID: <1992Jul18.124052.12192@solace.hsh.se>
Source record: 219561

In an earlier posting I said that I had troubles with Connect 1.06i and 1.08i.
The problem was that Connect would give 2 bombs whenever I tried to type
anything in the terminalwindow. This is due to some problems with QuickSTE 3.x.

I haven`t figured out why, so I just disables QuickST when I run Connect.
I don`t have Warp9, so I can`t say if connect works with it.

Otherwise the program is excellent (Just tested it for a couple of minutes).

702. ST Report and Atari Explorer Online

Newsgroup: comp.sys.atari.st
Date: 1992-07-18 16:14:59 UTC
From: hasse@solace.hsh.se
Message-ID: <1992Jul18.161459.13901@solace.hsh.se>
Source record: 219567

If anyone is interested I have uploaded ST Report issues 818->829 and
Atari Explorer Online 9201->9206 on a.a.u.e and ftp.uni-kl.de.

On ftp.uni-kl.de they will be found under /pub/atari/magazines

If you are getting them from a.a they will be found under /new with
filenames str818.txt.Z thru str829.txt.Z and aeo9201.txt.Z thru aeo9206.txt.Z

For all of you who don't know this, Z*Net magazine is now Atari Explorer
Online, read aeo9201 for more details.

I must say the circulation on these online magazines have been very poor
for the last couple of months, so I will try to keep them up to date, so you
all netters out there will have the latest issues on your screens!

If anyone got a mailing list, send me an e-mail so I can send you the
magazines to you for fast delivery (If it hasn't worked uptil now). I doesn't
mean that _I_ will set up a mailing list for everybody. I'll just pass them
on to those who have a mailing list.

708. UVK / Antivirus

Newsgroup: comp.sys.atari.st
Date: 1992-07-18 21:42:22 UTC
From: Steven.Wells@bbs.actrix.gen.nz
Message-ID: <1992Jul18.214222.5784@actrix.gen.nz>
Source record: 219572

Word of warning:

ST-Format is constantly advertising 'UVK (Ultimate Virus Killer)' as
the best virus killer around. Maybe so, but it thinks one of the most
common viruses, is safe!

The 'Anti-Virus virus' Looks very similar to V-Killers Anti-Virus
boot. Saying:

If an executable boot sector is detected, the screen will flash and
the computer will beep

(Or something along those lines)

The anti-virus-virus adds:

You may remove this anti-virus with reset!

Be careful - although it does tell you about executable boot sectors,
the anti-virus-virus, copies itself to any write-enabled disk that you
put into your disk drive. Causing the same damage as any normal virus!

UVK thinks it is harmless - but there are two versions:

Anti-Virus (English)!

&

Anti-Virus (Dutch)!

They are both just as dangerous, & except for the different language,
they do the same thing! So - if Ultimate/Super/Advanced Virus Killer
(Same program, different names) reports this, run another virus
killer, such as V-Killer, Chasseur II, or Sagrotan, and knock it off
the disk!

711. Re: ST to DOS

Newsgroup: comp.sys.atari.st
Date: 1992-07-19 02:31:52 UTC
From: Steven.Wells@bbs.actrix.gen.nz
Message-ID: <1992Jul19.023152.11912@actrix.gen.nz>
Source record: 219578

I'm surprised that not-everyone knows this yet! (Is it in the FAQ???)

Any standard 720k (or lower) format on an MS-DOS machine, can be read
on the ST. Formatting disks on an STE using the desktop formatter,
will make the disks readable by MOST (but not ALL) IBM-Compatibles.
(Due to slight differences in formats between various machines - some
will read the disks, and others won't!)

To be safe, format the 3.5" disk on the IBM-Compat' which the data
from the ST is going to be loaded into (or the data FOR the ST is
going to be put onto). This will ensure that the disk is compatible
with both the original MS-DOS machine that formatted the disk, and the
Atari ST/STE/TT (etc. etc) that is using it.

The ST will not read IBM-High density disks (1.44, 2.55 etc.) unless either:

1. The MS-DOS machine only formats the disks Double or Single Density

2. The ST has a high-density drive, and controller in it.

If options are asked for try to make the format:

2 Sides
80 Tracks
9 Sectors per track

and, if possible, don't use the following format types:

'twister'
'skewed sectors'
'fast format'

these are all very similar, or the same, and basically use a method
that lets the ST read data from the disk fractionally faster! (Only
noticable when using several large files.) Many IBM-compat's will not
accept these formats.

This should be of some help to everyone.

(Note: I have not used the term 'PC' which is usually attributed to
the MS-DOS based machines. Whereas, it's an almost universal term
meaning 'Personal Computer'. So the Atari ST, and even the Ameagre
are PC's!)

>The Gemulator _DOES_NOT_ support the spectre GCR. An IBM emulating an ST
>emulating a MAC. Now that would be a trick.

Why is that a trick? It's technically feasable and no hocus pocus is required.
The reason that Spectre won't run on Gemulator has nothing to do with
emulation of the Mac or 68000. It's rather quite simple: In Gemulator 1.0,
which will be hitting dealer shelves in about 6 to 8 weeks, the cartridge
port address space on the ST ($FA0000 to $FBFFFF) is simply not emulated.
So programs like Deskcart, Atari's VT100 emulator, and Magic Sac or
Spectre will not run on Gemulator. However, see below...

>
>By the way where were you planning to plug a cartridge into your PC?

Gemulator has 8 ROM sockets on it, which is capable of reading any ROMs, not
just specifically Atari ST ROMs. So you can take that ROM out of your Deskcart
cartridge or out of your Magic Sac cartridge and it can be read by the
Gemulator board. Mac emulation is definitely planned for a future release.

>important, it seems like a bit of work.

I think they send over the data serially to the gameconsole. The chip it's
just a shift-register (probably anyway). The signals that goes from the
controller should be something like:

Vcc (+5V or something similair)
GND
Clock for shift register
Load data into shift register
Clear shift register
Serial Data

This is just what _I_ think it is. I was working on a similair projact a time
ago, and the above is what I think is going on in a NES controller...

715. Looking for Atari Board for IBM PC

Newsgroup: comp.sys.atari.st
Date: 1992-07-19 06:00:28 UTC
From: mig@cunixb.cc.columbia.edu
Message-ID: <1992Jul19.060028.22071@news.columbia.edu>
Source record: 219580

I hear that there is an Atari board for the PC, called the Gemulator. Does anyone know anything about this or about a similar device or Atari emulator for the PC?

I also hear that there is a Mac emulator for the Atari, which will run on this board.

All I know is the following:
>The Mac emulator works on the GEMULATOR which is the ATARI STE emulator.
>The company to get in touch with is BRANCH ALWAYS SOFTWARE in Washington
>I do believe. Darek the founder is mostly seen in the ATARI newsgroup, so
>they would know how to contact him.

I would greatly appreciate all information about either of these, their compatibility and availability! Please respond via email, as I don't read the Atari groups.

Thank you very much for your help.

>
>Mmm, yum, yum. Can you please give any more information on these products
>eg. Who sells them, where, how much they cost and specs (like whether they
>can talk to a Mac network).

Who sells them: dealers and the developers themselves. :^)

Where: in the U.S. I don't know if they're sold overseas.

Cost: I think around $200 for U.N. for two nodes and $99 for P.N. for two nodes. I'm not sure however if P.N. is sold by dealers now. I think you should be able to get it from the distributor.

Specs: U.N. and P.N. aren't Appletalk-compatible. Chris Latham (PowerPoint Software) and Dragonware are supposedly working on other products, among them an Appletalk-compatible network. When, where, how much: I don't think they even know yet. :^) They just had a conference on GEnie a couple of weeks ago and this is one thing they mentioned.

>there are switches to format single sided 360k. This works OK as I've
>done it myself. You *must* use the PC to format, not the ST.

Not true. As long as you've got TOS version 1.4 or later, you can use ST
formatted disks directly on a PC. If you've got TOS 1.0 or 1.2 you simply have
to write a PC bootsector to the disk after you format it, a feature supported by
most extended-format programs.

Well, I don't know what you've eaten, but the original post put the
price of the Amiga A600 at 399 pounds and the supposed price of the
Falcon at about 600 pounds.
A bit heavy isn't it :)

721. Less and ger2en19

Newsgroup: comp.sys.atari.st
Date: 1992-07-19 13:31:54 UTC
From: dah90@ecs.soton.ac.uk
Message-ID: <12311@ecs.soton.ac.uk>
Source record: 219592

Can anyone tell me the address of the authors of Ger2En and the port
of Less (posted to the Gnu heirarchy on a.a recently)?

I have the following problems with them:

- ger2en19: crashes with QuickST (and doesn't save off properly)
- Less: searching doesn't work at all

Apart from these, they are both fine programs (no, really)

Ta, David.

Try ATY Computers in Oakland, CA. They advertise in most US mags so you
should be able to find their number there. He had a large tube of chips
the last time I was there (last week). I don't know if he'd sell them
separately though.

>Hmm, what do you mean by "unavoidable pachtes"? Don't forget, that only
>resident programs are allowed to change system vectors. If the are
>programmed cleanly there are no major problems.

I mean unavoidable patches by the fact that software moves on. Who here doesn't have at least _something_ in their Auto folder. Think of the many hundreds of people who have software screen accelerators - now those are usually direct replacements of bios code, or at least replacements of interupts normally serviced by bios routines. I didn't mean to confuse "program patches" that fix bugs with "TOS patches" (although that is perfectly ok too - look at all the TOS patches on A.A. - it almost never perfect and who could expect perfection anyway?).

>

>>.3 for compatibility reasons how about 21.3 structure?
>I think this would be _very_ bad for a lot of GEM programs. But don't forget
>that MiNT supports file systems without name limits.

Actually, I was thinking more in line of it being able to handle Minix partitions as well as it does TOS partitions now. That way people can keep their present TOS partitions, or they can use Minix partitions without _having_ to be in MiNT. I guess I just like the idea of Minix support in ROM.

>
>> 6) Software support for 2.88MB floppies (Last I heard, there isn't a
>>greyed out option for 2.88), and the possibility of swapping a: from the

>BTW, the new AjAX floppy controller supports a clock rate of up to 32 MHz,
>so there may be some hardware kits for 2.88 MB floppies in the future.

Are you saying that you don't think that Atari should have to have an option in the format command that supports the brand new 2.88MB drive that they made allowances for? Come on - if they built the specs to handle 2.88s specifically, then why cant they add the 1k or so to handle them? I still like my idea of floppy switching though. Heck, you could use that to switch A: with a re-writable optical if you wanted. :)

Any library should have a 3270 protocol guide. The 3270 protocol has been around so long that many communications books should have 3270 information. Also, since IBM invented the 3270 and its protocol, you can get that kind of documentation from any IBM Systems Engineer or marketing representative. Usually you have to purchase these guide, though. IBM's price may be too high for you.

I hade the same problem with monst2, that the screen was shifted time to time.
My solution is to patch monst2, by removing all instructions that moves to
ff8260.w (The resoultion register), you can replace the instruction with some
'NOP's.

From: lombardo@odin.unomaha.edu
Message-ID: <lombardo.711587570@odin>
Source record: 219599

Hello!

I am considering a memory upgrade from 1 meg to 2.5 meg on my 520stfm... I find myself running out of memory after running even small applications on the ST, because I have so many auto folder enhancements running. I hate being limited by how much memory I have. I think a 2.5 meg system would be perfect.

Now, I have looked through some magazines and priced out some of the memory upgrades available, but I thought I might as well ask Usenet readers which are the best (for a 520stfm) upgrades. I would like to install it myself, and I am comfortable soldering.

Also, if you have 2.5 meg, do you find you can do a lot more in certain programs, or was it generally not worth it? I would be VERY happy with 2.5 meg for the sole reason that I could have NEODesk loaded into memory, along with EdHack, my GEN ST Assembler, and the extensible control panel.

Hmmmmm, I think I may have talked myself into it!

BTW, I am also considering selling my ST and buying a clone... (they are SO inexpensive!) I would appreciate ANY flames regarding this. I have been an Atari user for a long time now, and I hate dos.... is windows as good as NeoDesk? (Or even GEM?)

The Nintendo controller uses a shift register IC to multiplex 8 lines to one input. There are 5 wires. Power, ground, clock, reset, and data. you *COULD* connect an Atari type joystick by simply hooking up the switches to their Nintendo counterparts. The Nintendo controller is not as complicated as it seems. I remember hooking it up to a TRS-80 once.

732. PageStream 2.2 fire

Newsgroup: comp.sys.atari.st
Date: 1992-07-20 02:59:23 UTC
From: jreiss@magnus.acs.ohio-state.edu
Message-ID: <1992Jul20.025923.26261@magnus.acs.ohio-state.edu>
Source record: 219600

Yes, I'm afraid I'm going to be adding a little bit to the growing number of flames in this group directed towards the supposed "upgrade" to PageStream 2.2.

I tried to use it. Really, I did. Tried for a whole week to find some way to get an adequate printout. I tried different drivers, (and found that Postscript worked to an extent. I'm not sure if the problem was the printout or the printer), tried freeing memory, tried all kinds of things, and couldn't get anything but bombs when printing to my Epson printer.

Now, the new features were nice (even though the toolbox STILL has excess space at the bottom in medium res), but what good are features in a publishing program if you can't even get a printout? And the features weren't that extreme anyway.

So, I've downgraded my setup back to version 2.1. If anyone comes up with a way to get printouts using 2.2 and the EPSONX driver, then I've kept the files around to return to 2.2. For the time being, however, the upgrade is to me unusable.

Thank you for listening to the angered ramblings of a disgruntled user. If anyone from SoftLogik ever sees this, please fix this most distressing problem.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

The wait is over! I just posted emacs 18.58 to aatri.archive.umich.edu!

The file names are:

1. 1858b-d3.zoo - everything needed to install/build a working
EMACS. Includes docs in LaTeX and ASCII form.

2. 1858d-d3.zoo - Just the docs from the above archive. If you
are not sure about EMACS get this file and
read the docs please!

I spent several weeks writing and editing the doc file. It is now 16 pages
with a table of contents and contains a wealth of information. It covers
installation and usage along with a lot of general information.

I will post source code at some point, I need to work on cleaning it
up a bit and documentingh some of the changes that I have made to it.

cheers,

scott kolodzieski
scott@sparc1.stevens-tech.edu

I think that it's in Atari's interest to have a the capability to
connect with existing Mac/IBM networks. ie. Play on their turf.

745. Editor using TERMCAP

Newsgroup: comp.sys.atari.st
Date: 1992-07-20 11:09:28 UTC
From: gti16@eva.informatik.uni-dortmund.de
Message-ID: <14e6t8INN72@fbi-news.Informatik.Uni-Dortmund.DE>
Source record: 219364

Hello everybody!

I am searching for an editor running well under MiNT AND(!) using
the TERMCAP file, so that it works also under MGR. When someone knows
about such an editor, please send a mail to me. And maybe you can
also include the address of a mail-server where I can get the editor
from.

Thanks in advance

Holger

746. Gnu Debugger GDB

Newsgroup: comp.sys.atari.st
Date: 1992-07-20 11:14:33 UTC
From: gti16@eva.informatik.uni-dortmund.de
Message-ID: <14e76pINN7n@fbi-news.Informatik.Uni-Dortmund.DE>
Source record: 219365

Hello everybody!

I am working with the Gnu C Compiler since a week and have also installed
the Gnu debugger GDB. But the debugger refuses to work:
When starting the debugger e.g. with `gdb program.ttp' (a normal
program or with debugger information from gcc), the debugger says:
"File not in executable format"!
It is the Gnu Debugger V2.6 (ST Patchlevel 12), and I am working with
a MEGA ST (4MB ram).
I am sure that the solution is very simple, but I dont know it.
Maybe someone can help me??

Thanks in advance

747. German Mail Order

Newsgroup: comp.sys.atari.st
Date: 1992-07-20 12:28:17 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1992Jul20.122817.25703@peponi.wcc.govt.nz>
Source record: 219366

I would like to get hold of the Hard Disk backup Program by
Application Systems of Heidelberg..

So are there any Mail order shops that I can Ring/Mail to obtain
this program, (note, I don't speak German) also will they accept
MasterCard..

So if some of you kind Germans could look into all those
great magazines that you get over there and let me know the prices,
and the possiblity to speak english..

I am not to worried about it being German, I have used version 2.0 with no
problems..

Also I now have some Germans for neighbours and also a chap from Germany
has opened up a Electronics a shop some 300 meters along the same road
that I live in, so I should have plenty of help with the manual..

Thanks......

Roger.................. sheppard_r@kosmos.wcc.govt.nz

I personnally use uux789 (at a.a): it may not be the best but it
works quite good. I even use it on the SPARC (compiled without
changes) cause it is much better for decoding multiple parts
files (images from news,...)

Look for sources of vibration on the table, desk, counter etc. where you keep the computer. Hard drives are an obvious source. These vibrations can cause the wheels in the mouse unit to turn even while the mouse itself is not moving.

Even very light vibrations can do this.

That's my suggestion.

Perhaps Jim, it would be on the back panel of GEMULATOR where the joystick
port is located. Last I heard rumors has it that GEMULATOR would later be
allowed to have Mac ROMS then with the proper software emulate a Mac from
the ST interface.

755. Recent KA9Q wanted

Newsgroup: comp.sys.atari.st
Date: 1992-07-20 15:59:49 UTC
From: tony@microware.co.uk
Message-ID: <1078@mwuk.UUCP>
Source record: 219394

Hi Folks,

I am looking for a recent version of KA9Q for the ST. I found one for
FTP on plains.nodak.edu, but it is dated somewhere in 1988.

I'm really looking for a NOS version rather than a NET version.

Any pointers gratefully received. Email preferred if possible.

Thanks in advance.

Tony.

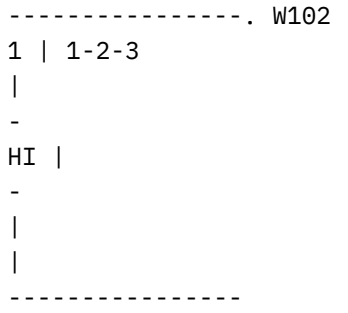
It looks as though I just got lucky with my upgrade to TOS 2.06!
My 1.6 and 2.06 tos versions were both the same type (32 pin type 27C010A)
Here follows the jumper settings for other ROM/EPROM types:
From the STE Computer Field Service Manual (C302481-001 REV A Aug 91)

ROM Jumper settings:

ROM/EPROM Part type W102 W103 W104
27256 Don't care 1 and 2 N/C
27512 2 and 3 2 and 3 N/C
571001/27C1000/531000 2 and 3 2 and 3 2 and 3 (the default setting)
27010/571000/27C1001 1 and 2 2 and 3 1 and 2

The jumpers are located next to the HI eprom

W104 W103
1-2-3 1-2-3



Hope this helps

I've tried this on the PC's in my lab, and they give me the message
"Options not supported by drive". ARGH!

I've got some pre-formatted 720 K double sided disks, and I think I can
get at a friend's 1040 with double sided drive. This should work..but
it's definitely going the long way.

These systems are priced out of consideration in my opinion.
Similar products for the Mac and PC sell for 1/3 the price, or less.

760. Falcon price

Newsgroup: comp.sys.atari.st
Date: 1992-07-20 17:21:46 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Jul20.172146.13874@crc.ac.uk>
Source record: 219377

There seems to be a lot of confusion about my original posting about the
expected price of the Falcon when it is released.
What I said was that it would almost definitely cost
LESS THAN 600 ENGLISH POUNDS!!!
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
I didn't say anything about the price it will be in America.
(I thought this was pretty obvious the first time :-))

This isn't meant to be a flame or offensive to anyone.

BTW when they say "less than 600 pounds" it usually means 599.99!!!

Phil
"when you pull the pin out of Mr Grenade, he is no longer your friend!!"

761. Setting up MiNT on a TT??

Newsgroup: comp.sys.atari.st
Date: 1992-07-20 18:11:31 UTC
From: paul@jupiter.noname
Message-ID: <1992Jul20.111135.3503@arizona.edu>
Source record: 219378

I've been trying to get MiNT 0.94 working on my TT, but without much luck. In one documentation file, it says to put mint.prg in the auto folder, but in another file it says this doesn't work on a TT--mint has to be started after GEM. But when I start it after GEM, it simply locks up the system. And when I run it from the auto folder, it seems to work all right (i.e., it runs), but then it messes up certain programs (c-kermit won't dial out and Gulam goes nuts).

Is there something I'm doing wrong? I think I've heard of another version of MiNT running on a TT, but I can't find it anywhere. Any suggestions?

>could it be something else, overheating? Help please

Something similar happened to me a while ago. I tried to have someone
exorcize my Atari to remove the demonic spirits, but alas to no avail.
It seems that vibration from my industrial strength hard drive caused the
mouse's optical wheel position sensors to stutter, thus moving the cursor
without moving the mouse.

If your problem is similar, try putting a towel underneath either your drive,
or your mouse pad.

Erik R Johnson

763. FALCON/LYNX/TT/MiNT/Yadda/yadda/yadda

Source record: 219381

Just a question, not a complaint:

Why is comp.sys.atari.st to hardware-heavy, and so business-application-software heavy? Unlike the other comp.sys. groups, there is very seldom any discussion here of recreational software.

I mean, the ST has a reputation (undeservedly, I know!) of being strictly a games-machine. But doesn't ANYONE use it for games?

Is is because we are trying to overcome that reputation?

Or is it because the software has already been discussed-to-death by the time it gets ported to the ST?

Gary Anderson

In article <12311@ecs.soton.ac.uk> dah90@ecs.soton.ac.uk (Halls DA) writes:
>- Less: searching doesn't work at all

no, and other things are broken, too. (note that i did NOT post this
version of less so don't ask me questions about it. i d/l'd it, tried it,
then tossed it out in favor of my own port. [another reason why having src
to vital utils is extremely nice. another reason why having portable src
to vital utils is effectively nirvana]).

i built my own less 177 from original unix src. there were only a couple
of changes that needed to be made. note that i believe it only runs under
MiNT (tested daily with 0.94). i built with gcc 1.40 and MiNT libs PL 19.
does all the "fun" stuff:

- runs editor (micro emacs in my case)
- runs commands (eg ls)
- suspends (under MiNT and tcsh)
- deals with binary data in files

only thing i don't like is default is to have `:n' go to next file rather than
just `N'.

since in don't recall if i started with comp.sources.unix version or convex
version, i don't want to post it. i can, however, diff it and post those.
i think the only changes had to do with with things like default file names
(eg /usr/local/lib/less.* vs c:\lib\less.*). maybe some termcap stuff, too.

I have this problem with my new mouse ("Zydec", or something like that -
it's a white mouse with an orange icon on it and an "amiga/atari" switch
on the base - apparently they all do it, even on the amiga (except that,
since the logic is not quite the same, it "jiggles" on the amiga, rather
than just suddenly starting to wander)).

The manual tells you how to do this. Grab the document "gcc-st.zoo" from the
/atari/gnustuff/tos/doc directory on atari.archive.umich.edu, and look at the
documentation for "sym-ld". Basically, you have to do two "ld"s - one to create
the executable, the other to create a real symbol table.

I don't know the full details, because I use the G++ component of GCC, which
apparently doesn't work with GDB yet on the ST.

The package *should* contain the German or English documentation. TURBOASS.LZH
is available on atari.archive.umich.edu but I am not certain if it contains
the docs, however due to the large size I am suspecting that it does.

Sincerely,
Mark Kovarski

771. CLA_V1.PRG PROBLEMS...

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 00:41:00 UTC
From: grant.ranson@outlan.ersys.edmonton.ab.ca
Message-ID: <1982.79.uupcb@outlan.ersys.edmonton.ab.ca>
Source record: 219520

TO: ALL

I recently decided to try the digital circuit simulator, CLA_V1.PRG, and always get a TOS error #53 when I attempt to run it. Admittedly, I have an _OLD_ ST, with TOS 1.0 and a mere (by today's standards) 1MB of RAM, so hearing that my TOS is too old wouldn't surprise me too much. I have tried running CLA_V1.PRG in and out of Neodesk, and the problem persists -- consistently TOS err #53.

Has anyone else encountered this problem, or something similar? Were you able to solve it? Any help would really be appreciated.

Thanks.

(grant.ranson@outlan.ersys.edmonton.ab.ca)

772. ICD and partition types : HELP please

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 01:32:26 UTC
From: dtarico@violet.ccit.arizona.edu
Message-ID: <1992Jul20.183226.1@violet.ccit.arizona.edu>
Source record: 219386
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

In the ICD hard disk formatter, it asks for partition types. The manual hints that type other than GEM and BGM are possible, but it says nothing about what the other options are. Does anybody know what types of partitions are allowable? I want to set up partitions (large ones) for DOS and Spectre. What types of partitions should I specify for these? Any info would be appreciated. Thanks.

P.S. large = >32 meg, i.e. GEM doesn't cut it. Spectre seems to work fine on a BGM partition, but DOS doesn't seem to like it. Is BGM acceptable for either of these operating systems, or will it cause problems?

> krakover@spot.coloardo.edu

There is nothing wrong with ger2en19.lzh on a.a. its the LHarc program that you are using to unpack them, it is a lh5 type archive..

Please use LZH201L, I don't think there is a english version yet, but a English LZH201ie is on ftp.cs.tu-berlin.de (130.149.17.7)

Note: the LZH201X archiver is packed with PFX/AFX as well, so the program has to be renamed lharc.ttp and run with this ttp string x -xhm lharc.ttp, this will extract the other bits that are inside the archive, if you run the ttp as it stands with a blank line it will list all this information, but note, it is at the end of the help info..

>BTW when they say "less than 600 pounds" it usually means 599.99!!!
>
>Phil
>"when you pull the pin out of Mr Grenade, he is no longer your friend!!"

Well if its that price you might as well forget it here, PC'c sells for far
less than what that would cost here and there is the software support, there is
none here now for Atari, Atari is a dirty word here..

The price here would be some $2400nz I can get a 386DX with SVGA Monitor 40meg
HD. for some $1800nz and great support plus the software I need and as
many books as I can read..

But tell me, what would I get with this Falcon..??

To us here the Falcon is just a big joke, no support and no software for it,
and no books, plus you could be locked up for using a dirty word..:-)..

My next machine will be a PC clone, it is a simple as that...

Gerd:

Only the Midi Maze I files are ASCII. Midi Maze II uses what is
(apparently) some encoded methodology that makes them uneditable via
a simple ASCII editor.

I'm also very interested in a copy of the MM-II editor, if anybody
out there would like to help me out....?

780. problems with gcc/g++

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 03:57:01 UTC
From: <>
Message-ID: <bnell.711691021@cadillac>
Source record: 219397

First I'd like to thank everyone for mailing me the crt0 & gcrt0 files.
I've got a new problem now! I'm writing some C++ code and I'm having
problems with one file. Whenever I compile it (using gcc -c file.cc)
the result file comes out to be like 95 bytes. gcc doesn't report any
errors or anything and if I try to link file.o into something it just
complains that it can't find any of the functions in that file (obviously
since it is only 95 bytes!) All my other files come out correct. The
only difference in this file is that it is a class that uses templates.
So, can anyone tell me what's wrong???

Many thanks,
Bill

From: kevin.suggs@matrix.sbs.com
Message-ID: <141.587.uupcb@matrix.sbs.com>
Source record: 219535

I recently purchased PC-SPEED,had it installed and all the IBM software runs beautifully.However when I tried running my Atari sequencing and other midi software the computer just locks up! I contacted the people I purchased it from and they said they had never heard of this problem. I have left countless messages on BBS's all over the U.S. and the only reply I ever got stated that even when you're not using PC-SPEED it somehow still affects the midi ports,slowing down some routines causing the computer to lock up!

Has anyone heard of this and/or knows how to fix the problem?I am at my wits end!(short trip I know). Any and all assistance will be greatly appreciated.

785. Trouble with MiNT 0.94 and GEM.PRG

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 06:56:05 UTC
From: prevot@smr.slb.com
Message-ID: <1992Jul21.065605.29502@slcs.slb.com>
Source record: 219516

Hello group,

for some time now I've been unable to use GEM.PRG... I use MiNT 0.94
on a standard Mega-ST 4, and I've removed everything but MiNT from my
AUTO folder. When I run GEM.PRG, the screen goes blank, I get the "busy
bee" mouse pointer, and then GEM.PRG announces "Exit code 64538", ponders
for a couple of seconds, gives me 3-4 bombs, and then resets the machine!
Pretty heavy eh?

Does anybody have any ideas on this problem, or at least know the meaning
of this error code? Any help would be appreciated...

Please e-mail to spengos@germinal.ibp.fr

Thanks!

786. SSD (solid state [EPROM-] disk)

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 09:26:24 UTC
From: stenny@troja.stgt.sub.org
Message-ID: <0936.07.92@troja.stgt.sub.org>
Source record: 219529

Hi!

some people were interested in the project "Eprom Disk" the german
magazine C'T published some time ago.

I looked it up and found a lot of paper :-), so I don't post any of the
articles, but I think if someone has further interests in this subject, he
(she) should post this and tell the rest of the people who want to know
about it, that he (she) is willing to email 'ct@ix.de' to ask for the
possibilities to get the articles mentioned further on and the software
accompanied. Here, I must tell you, that the main part of the software,
mainly the driver program for the 512kB (1MB) eprom disk wasn't published
in the magazine, due to the length of the source text. These programs are
only available on disk, or perhaps via ftp from:

o ftp.uni-paderborn.de
o ftp.uni-regensburg.de
o ftp.uni-duesseldorf.de (after 1800 [0600pm] local time)

if one of these servers archives the files, for they are rather old :-)

Ok, here are the results of my research:

```
c't issue | contents
-----------|------------------------------------------------------------
1/86 | 128 kByte Eprom-Bank. This only shows how to connect the
| 128kByte available at the Rom Port.
9/86 |
12/86 | These two issues describe some software to deal with the
| 128kByte Eprom described in 1/86. 12/86 describes a block
| device driver to use the eproms as a 128kByte SSD(*)
7/87 | a universal interface, to connect IBM-PC-bus cards and
| ECB-BUS cards to the Rom Port. This interface provides the
| possibility to install 512kByte eprom at the Rom Port. A
| piggy pack offers another 512kByte.
9/87 | a bus driver card for the Rom Port, built with SMD chips
10/87 | Software to deal with the 512k (1M) eprom space, as described
| in 7/87. Included is a description of the block device driver
| to use the eprom bank as a SSD. The source code itself is not
| printed.
(*) SSD = Solid State Disk
```

hope this helps,
if someone needs some more infos, feel free to write mail :-)

787. Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 09:56:11 UTC
From: Edward.Visse@wblab.lu.se
Message-ID: <1992Jul21.095611.6118@pollux.lu.se>
Source record: 219502

Hello out there!
Since I'm rather new to this newsgroup, these questions may have passed
already. Anyway, here they are again:

Does anybody know when Spectre v3.1 will be released?
Will it run system 7?

When running Think Pascal 2.0, the debugger does not work:
Using GO, the program starts up, but when any key is pressed or the mouse
is moved, the computer hangs up on me.
Is there a patch to solve this problem or is it solved in a later TPascal
version? (I used different systems and finders but the problem stayed)

Thanks beforehand for any information

- Greetings - Edward

>And when I run it from the auto folder, it seems to work all right (i.e., it
>runs), but then it messes up certain programs (c-kermit won't dial out and
>Gulam goes nuts).

On the TT you put mint.prg in the auto directory and the config file
(mint.cnf) in the root directory. This works fine for me. Make sure that the
config file is correct for your system.

Both Gulam and C-kermit (version 5A-Beta) work fine for me. (By the way, yet
another of my ongoing projects is a port of C-Kermit for MiNT without it
being as (unnecessarily) emasculated as the TOS version from Columbia.)

>
>Is there something I'm doing wrong? I think I've heard of another version
>of MiNT running on a TT, but I can't find it anywhere. Any suggestions?

791. Pagestream 2.2 problems

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 12:00:11 UTC
From: heiden@kboeng.enet.dec.com
Message-ID: <1992Jul21.120011.11155@decuk.uvo.dec.com>
Source record: 219504

Last week I reported about my problems getting Pagestream 2.2 to work with
Edisk 2.1, the Ramdisk provided to the ST community by Volker A. Brandt.
Meanwhile I found out that the problem is caused by not providing enough
memory for Pagestream. Especially printing and importing of image files
requires more memory than I thought. Using the Postscript driver and a few
import modules, I need about 1.4 Mbyte (1 page doc).
Since many people reported similar problems, I strongly suggest to take
a real hard look into the machines memory situation.

792. Falcon again

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 12:11:43 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Jul21.121143.23551@crc.ac.uk>
Source record: 219505

I wonder who will be the first person to post some RELIABLE info about
the Falcon's specs?
I expect there to be a large rush of postings after the unveiling in
Dusseldorf(I think it's there anyway :-)).

I was thinking of buying a new ST but I would like to know what the Falcon
will be like first.
Is it OK to buy one of the first Falcons when they come out?
I have heard that the first few of every new computer has lots of bugs in.
Is this true and if so, how long do I wait before they are fixed?

BTW If you are thinking of getting a memory upgrade I would suggest going
to Evesham Micros. (I am not connected with them at all).
The story goes like this.....
I bought a 1meg upgrade for my STFM. When I took apart my computer I thought
it was just a tad too complicated for me(not being the most technical minded
person) so I took it back to Evesham Micros for them to put it in.
I am glad I did this now because even though I gave them the 1meg upgrade,
they fitted 2megs (to make 2.5megs all together!) plus they only charged me
20 (english) pounds to install it! Not bad eh? Saved a few quid there! :-)

Anyway, got to get back to work now.
Phil
E-mail naffara@uk.ac.crc

PS I have just heard of an ST emulator for PC's (Gemulator?) Where can I get
this from. I might be able to persuade my boss to buy one. Then again...

793. PD Hard Drive Backup?

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 12:40:28 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1992Jul21.124028.2439@aston.ac.uk>
Source record: 219507

Hello there! Since I'm about to receive my first ST Hard drive (it's in a tower case with a 4 Meg ST :)) I'm going to need some kind of hard drive backup program. I can't really afford to buy one, but there appears to be a plethora of Public Domain stuff around, so to save me trying them out, could people mail me telling me which they think is best and why? I'll post a summary to the net when I get the info. Thank in anticipation...

795. PageStream fire extinguished

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 13:09:44 UTC
From: jreiss@magnus.acs.ohio-state.edu
Message-ID: <1992Jul21.130944.14176@magnus.acs.ohio-state.edu>
Source record: 219506

Well, after reading many an e-mail and followup from people who had PGS 2.2 working under a setup very similar to mine, I decided that I had to try one more time to use PageStream 2.2.

I copied the files back from my storage area to my work disk and did the necessary gymnastics to insure it was properly set up. I then selected a file that I had not tried to print previously. I chose print. I chose OK. IT PRINTED!!!

Hmm. Okay. Now, what about that file that had been giving me all the trouble. I loaded it. Selected print. Selected OK. IT PRINTED!!!

Well, I don't know what I did, though I have my suspicions. Anyone who works with computers knows that there is no surer road to paranoia than a bug that disappears for no good reason. But, I can't argue with success, so...

Here's looking for a beautiful friendship with PGS 2.2.

Oh, and does ANYBODY have any idea how to shrink the toolbox window to a REASONABLE size in med res? That extra inch of waste drives me crazy!

797. ATARI STE vs. ATARI MEGA STE

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 14:12:42 UTC
From: mapugh@apgea.army.mil
Message-ID: <1992Jul21.141242.1979@apgea.army.mil>
Source record: 219512

Hi!

I have a few questions about the difference between the Atari 1040 STE
and the Atari MEGA STE. Apart from the obvious difference in looks
I can't seem to find much information regarding the difference between
the two. I've heard that the MEGA has the same CPU (68000), but that
it runs at a faster clock speed than the 1040 (16 MHz vs. 8 MHz,
respectively). Are there any differences in graphics modes? Do they
both support SCSI? Why should I consider the MEGA STE over the 1040STE?
I understand that both machines incorporate BLITTER and PCM stereo sound.
The only considerable difference I can find is that the MEGA is shipped with
TOS 2.06 as opposed to TOS 1.6. At any rate, can anyone tell me why
I should buy a MEGA as opposed to the 1040 (STE)???

Please respond E-Mail to <mapugh@crdec.army.mil>

Thanx in advance . .
^

Source record: 219513

This library (readline.olb) is in my c:\lib directory, but I can't remember where it came from and what source created it. I know that I didn't build it - so it must of come from a ".zoo" file. Anybody know what this lib is??

Bob Malay

802. GIF to DEGAS converter, does it exist?

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 15:44:02 UTC
From: hjb@levi.th.vu.nl
Message-ID: <1992Jul21.154402.29321@cca.vu.nl>
Source record: 219514

Does anybody know of a (PD) program that converts .gif pictures into Degas-format pictures (.PI3)? The reason I ask: I have just found this nice little program that replaces the boring grey background canvas of the TOS desktop with a Degas-picture. Converting .gif to Degas would render an almost infinite number of possible backgrounds, since there must be thousands of gifs around.

Thanks, Hendrik Jan Bosman (hjb@th.vu.nl)

Well, I've only used Universal Network once, at my local Atari dealer, and then
for only a few minutes. It was connected between a TT and a Mega STe, and was
used to allow the MSTe to access the TT's hard drive. They didn't have a net
printer set up there, so I don't know if that can be done, and I have no idea
about Appletalk/Novell compatibility.

>SPECTRE is a lot Faster (thanks to my ICD FA.ST Disk) than my Brothers Mac
>Classic & Runs WordPerfect 2.1 Mac which is vastly superior to any Atari word
>Processor. (superior to WordPerfect Windows 5.1 for that matter)

This is true, both about the chances of emulating a MAC II, and about the
speed, Spectre is wonderfully fast. Anyway, I *do* see one option for Color.
The original MAC OS has 8 colors built into it. The Roms support those colors,
but unless you add SCUZZIGRAPH, you can't display them, and then only on
another monitor. Fine, however, the Atari CAN display those 8 colors and more
(especially with the newer high-rez cards). I'm absolutely *sure* that there
should be some way to access those 8 colors and make them visible on the screen
with ST hardware. Anobody got Dave Small's e-mail address? It's not many
colors, but even 8 would be nice!

807. MegaSTE vs 1040STE

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 17:26:25 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <21JUL92.13262518@cc4.crl.aecl.ca>
Source record: 219519

One netter asked why a MegaSTE should be considered over a 1040STE.

First: Cost. If you price out a 1040STE plus a monitor and external 50meg hard disk, it is more expensive than buying a MegaSTE with monitor and internal 50meg HD. I sell Atari equipment and advise the purchase of a 1040STE only if it is to replace a 1040STf or 520 and the owner already has a monitor and HD. Examples prices are

1040STE $CDN459
SM147 $CDN199
52meg HD$CDN625 (Stealth 42)
Total $1283

Mega2STE/SM147/50meg HD $1154

Why buy a 1040STE???

Second: SLM605 compatibility. I tried five 1040STEs with two SLM605s and every combination produced ragged output (pixel displacements). I contacted Atari Canada and asked to have an advisory posted but I have seen nothing yet (that was 3 - 4 months ago).

Up above where I wrote 42 meg STealth, that should have been a 52 meg HD.

I hope this info helps.

808. 950 Magazine?

Newsgroup: comp.sys.atari.st

From: turbine@cix.compulink.co.uk
Message-ID: <memo.535084@cix.compulink.co.uk>
Source record: 219523

Frontier Xtra-RAM delux is one of the best boards avaliable for the job as it also gives you the oppertunity to upgrade to 4Mb later on with SIMMs. Not all Sts can cope with 2.5Mb. If yous can you will have to switch off 512K but the manual explains how to do that. It also comes with a test disk to check the memory after installation. For most machines no soldering is required.

Hope this helps.

812. More MiNT q's, Why not a MiNT FAQ?? :)

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 19:00:45 UTC
From: snoret@egon.unx.sas.com
Message-ID: <Brr659.G8w@unx.sas.com>
Source record: 219525

Well, add my name to the list of folks who would REALLY appreciate a little
help getting started with MiNT! :) I'm trying to get a minimum setup (trying
to fit everything on one disk, formatted to > 900K) so that I can do a demo of
itit for my users group. I have MiNT, mgr, and the MiNT port of ksh on the disk, with a
little
room to spare, so every path will be A:\<something>. MiNT starts
without a problem, so does mgr. But as soon as I try to define a window, I
get the somewhat infamous "Can't get pty" error. As far as I can tell, I
have things set up right. I have renamed mgr as the init.prg. and I have
ksh and its path defined. Is there something else I'm supposed to do?

The docs for both MiNT and mgr are exceedingly sparse when it comes to
installation and configuration examples. Is someone currently working an
a MiNT FAQ? How about a "MiNT Installation and Setup Guide"? If I get
responses and help, I would be willing to get one started and post my
results.

So, I guess what I need is:
1. where do the various *.rc, *.cnf, etc. files go? auto, root, where?
2. what do I need defined in these files? paths, devices, what?
3. what order do things need to be in? MiNT first, then what? and where?
4. any other tips and hints greatly appreciated

Thanks in advance for your help!

>Gemulatorboard that you put in your PC. You don't have the 'GCR' function
>though; so you can r/w Mac-disks, but the Mac-emulation should work...

This is incorrect. I've "spoken" with Darek about this, and this is what is
actually happening:

There is a spot on the card for the Mac Roms.

IF Dave Small wishes, he should be able to write a version of Spectre that
will access the Roms there instead of at the cartridge port. However, it will
not just plug-n-play, there will have to be some work done.

However, it *should* work, if people out there want it to and are willing to do
the work to make it so.

A friend is selling his Atari 1040ST to generate tuition money. The machine is a straight 1040ST with 1 Meg of memory and a color monitor and mouse, and comes with WordPerfect and CopyIIST software bundled. He's asking $350 firm for the whole package.

This would be a good starter computer for someone interested in Atari MIDI applications. If interested, you can Email me or contact the seller directly at

curtis@mail.loc.gov

Thanks a lot.

Hmmmm, I modified a Sega light gun to work with my 130XE, and it was a bit more complicated than that. I don't have the instructions handy, but it involved making a sort of adapter out of a joystick extension cord. More than two of the wires have to be rearranged. Another thing I remember is that when I first tried it on my XE, the gun would fire when I _released_ the trigger, not when I _pressed_ the trigger. The microswitch that the trigger actuates (what Mark calls a "trigger detector") was a NO (normally open) [or maybe a NC I don't recall exactly], and the Atari was expecting the opposite "signal", so I went to Radio Snack and bought the other type microswitch. It took a bit of kludging to get it mounted in the gun properly, but I did it. (What a way to spend a July 4th weekend!) Now I can blast barnyard beasties or shoot crossbow bolts to my heart's content (don't play them much anymore nowadays).

But by all means, folks, try Mark's mod. If it works, fine. If not, mail me and I'll upload and post the directions (they may be on atari.archive, I'm not about to look at the _huge_ Index now!). Of course, I could have spliced the wires, I just liked the "adapter" idea, but then had to change the switch anyway. Maybe some Sega l'guns are different...?

One of the local dealers sells converted Sega light guns for the 8-bit Ataris. If you would rather buy than hack (they're not outrageously expensive as I recall), mail me for the address/telno (he does a mail order business).

I looked at a Genesis controller, and it uses a quad 2-1 multiplexer: a single select line chooses what two other lines carry- A/B and C/start. I have no clue about the Nintendo, but I bet it's similar. I think the chip in the Genesis is a 74161.

|
|Setting the BJ to Epson mode (see the manual - it's a DIP switch) may
|make the built-in "Epson, Final, Dot Matrix..." set-up work.
|
Why?
BJ normaly 'imitates' an old IBM-Mode, that's enough to emulate a
dot matrix printer. You just have to switch the atari-internal set-up
to Epson, not more, when you have a big BJ (for A3-Papier), there is
no change nessesary!

821. MiNT, ksh, MGR, blah blah blah

Newsgroup: comp.sys.atari.st
Date: 1992-07-21 22:34:23 UTC
From: azog@world.std.com
Message-ID: <BrrG1D.L91@world.std.com>
Source record: 219531

Ive recently gotten MiNT 094, and MGR, and have some questions.

For those who dont know MGR, is a way cool window manager, rather
similar to early versions of X. I run it on my AT&T 3b1. It includes
a window manager, and stuff to handle client/server.

Has anyone done anything with MGR lately? Ive been collecting the MiNT
libraries and am going to attempt to write some MGR specific stuff,
both on the ST and the 3b1.

One real neat thing to see, even if you know it exists, is to see a
MGR client running remotely, doing stuff on your local machine.
On the 3b1, I started eyes, and it followed the local mouse pointer.
Pretty neat.

One last thing. WHen MultiTOS becomes available to everyone, is MiNT
gonna die? I sure hope not! With the above software, Ive given my
ST a totally new look

Thanx

The old Atari ST is being retired from active duty to serve as a games machine and educational computer for the young one. Pieces that aren't needed by a pre-schooler are up for grabs.

Megafile30 Hard Drive. Seven months old.

Will sell populated with a good selection of public domain software and some (legal) commercial titles. About a half-dozen disk magazines as well.

Asking $399 CDN. About $335 US.

Star NP-10 Printer.

Dot matrix printer with feed-forward tractor. Throw in some fanfold computer paper (about 500-1000 sheets, I think). Cable for Atari ST, of course, included.

Asking $49 CDN. About $40 US.

Various Atari books, at $5 a pop. Titles include:

Compute!'s Guide to the AES

Compute!'s Guide to the VDI

Compute!'s Book of Atari Machine Language

Compute!'s Programming the Atari ST in C

Abacus's Atari ST Internals

I did those titles from memory. They are close enough and there are few enough books on the Atari ST that you should be able to figure out which I'm actually talking about.

All of the above subject to 'best reasonable offer' clause. Shipping can be discussed depending on your location and volume of purchase. Course I'd rather sell in the Toronto-Kitchener corridor, and can probably arrange delivery in such an area.

Brad

I know it's been said before, and it'll probably be ignored this time
and will have to be said again. The best way to shut up people like
this (who subscribe to these newsgroups just because they like to see
their names in the middle of a flamewar) is to ignore them.
Actually, this post is probably doing more harm than good in that
respect, but something has to be done.

Many of us may not like Mr. Sheppard. But he has a right to post. If
you don't like what he has to say, then that's what the 'k' key and
kill files are for.

Just my $.02.

>only difference in this file is that it is a class that uses templates.
>So, can anyone tell me what's wrong???

What's wroing is that Bill, like me, didn't read the C++ Reference Manual
very carefully.

Templates are not "compiled". That doesn't make any sense. Templates can
only be compiled once they have been instanciated. Here is the usual usage:

main.cc:

```
#include <SetTempl.cc>

main()
{
Set<int> MyIntSet;
...
}
```

SetTempl.cc:

```
#include <SetTempl.h>

template <class T>
Set::Set()
{
...
}
```

SetTempl.h:

```
template <class T> class Set {
...
};
```

Spectre does not bother with limiting the size of the ST screen to the measly
stinking 512*384 (you were close) resolution of the Mac series, it goes
straight for 640*400 and higher, which nearly all Mac software handles just
fine.

I believe it no longer works in color.

Hello, since vltbin (The Vault) doesn't seem to have The Key in with it, I have put a copy of The Key in the atari/new directory at atari.archive. The filename is thekey.zoo and include key.prg, key.rsc, vault.tex (the original documentation for Vault and Key), touch.ttp (don't know if its needed but was included with the older distribution of vltbin), and 2 readme files that were with the older distribution also. I hope that this is of use to everyone who has the vault and not the key.

834. differential equation solver available?

Newsgroup: comp.sys.atari.st
Date: 1992-07-22 06:56:43 UTC
From: dont@klic.rain.com
Message-ID: <1992Jul22.065643.16727@klic.rain.com>
Source record: 219455

A friend wants to investigate chaotic behavior. I have looked at the archive listings and don't see a differential equation solver availble.

Does anyone know of one?
Or a program that displays the Lorentz chaotic functions?

If not, I can make some reasonable sense explaining what to code to handle the mathematics. If someone else can handle the Atari St specific things like handling monochrome vs color, etc, we could put one together fairly easily. The source in Numerical Recipies can do the solving. Maybe even stereo 3-d.

How about a newer version of Fractint than is on atari.archive?

Thanks

Stop being a bigot Bill, the same can happen if you are using the old Zoo 2.01 with new Zoo 2.1 files..

Zoo is a Unix port, not all Atari users are Unix nuts, mind you Unix can turn you nuts..:-)..

Its like the help info in one of the Unix ports that I fond on A.A. it used the Unix text format with no CR, so is this the way that you freaks program so that you can't even list the help info in the ttp..??

This was the tarz or compress program that did this, and was not the doc file, and why can't we have standard Doc files that we can list on the Atari as it stands, by using the desk top..??

Also Bill you have been out voted here, so live with the fact..

Well I have just posted the Great freeware word processer called
dbWriter v1.8 onto atari.achive.umich.edu in the new directory..

The is a MONO word processer with mail merge/spell checker and a thesaurus,
also has some nice graphic features, but please read the docs....

There are a total of 5 files..

archive file size
Files are dbwsupp.lzh 90k
dbwacc.lzh 35k
dbwriter.lzh 104k
dbwthes.lzh 141k
dbw_dict.lzh 106k

all (lh5) archive, use LZH201L to extract..

Files that were posted on GEnie this week-end..

Roger..... sheppard_r@kosmos.wcc.govt.nz

How old is your ST? If it's a 520ST (no F,M or E) then it probably has a
revision 1 keyboard chip which suffers from mouse 'drift'.

>so much for the wonderful lharc program and its "superior" desktop
>capabilities. yet another stumped usenet user...

I'll admit, I was rather impressed when I tried to unpack a zoo
archive compressed with a newer ZOO and the older ZOO program told me
to go get a newer version. But, just because ZOO has this feature
doesn't mean that it's so much better.
I know that ZOO too has managed to stump many a usenet user. (like
remember to pack after delete).

In any case, I won't argue that dead end too far since Questor's
lharc by itself is by no means user friendly. But I would ask again
that ZOO add an option similar to the one in Lha v1.00:

w=<dir> specify extract directory

Doesn't seem too big of a request, and it would make ZOO that much
better and easier for many users.

That may be true: Atari is dead. Why not ?
The problem is: is a PC able to make you live ?
I'd like a better machine than my good old ST (partly cause of my buggy HD) but not a PC rather a real Unix box.

PCs are patchwork !

: Hi!
:
: I have a few questions about the difference between the Atari 1040 STE
: and the Atari MEGA STE. Apart from the obvious difference in looks
: I can't seem to find much information regarding the difference between
: the two. I've heard that the MEGA has the same CPU (68000), but that
: it runs at a faster clock speed than the 1040 (16 MHz vs. 8 MHz,
: respectively). Are there any differences in graphics modes? Do they
: both support SCSI? Why should I consider the MEGA STE over the 1040STE?
: I understand that both machines incorporate BLITTER and PCM stereo sound.
: The only considerable difference I can find is that the MEGA is shipped with
: TOS 2.06 as opposed to TOS 1.6. At any rate, can anyone tell me why
: I should buy a MEGA as opposed to the 1040 (STE)???
:
: Please respond E-Mail to <mapugh@crdec.army.mil>
:
: Thanx in advance . .
: ^

Twice as much power is really nice and a hard drive is unavoidable
unless you're only playing games. A 1040 STE is not so cheaper than a
mega STE (with the same hard drive): the SCSI adapter is not included
in the 1040.
And of course as a secondary effect, you get TOS 2.06, separate and better keyboard, VME bus and sometimes 1.44M disk drive !

To be fair, I guess that many of the people who write these programs aren't aware that the US has a different video setup. Restricting things on that basis isn't really realistic for what is essentially a british magazine, the reverse of course being true as well. To be honest, if you've got access to the net, you can probably get much better software than what's appearing on these cover disks, anyway. As for the magazines themselves waking up, I wouldn't hold your breath - the only decent UK magazine at the moment is ST Applications.

>
> Thanks in advance for your help!

I think this is a very good idea. I have some questions as well.

1. if you get MiNT (0.94) in binary form you find the mintshel.prg.
It should be a shell. But when I try to do an ls, dir or pwd I
always get the answer cmd exit with -33 or so.
Do I need to get some utilities which should be put in a bin directory
or is my configuration file of the shell wrong.
2. Did anybody use Pure C with the MiNT libraries, does this work.

846. Falcon price

Newsgroup: comp.sys.atari.st
Date: 1992-07-22 12:54:17 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Jul22.125417.5603@crc.ac.uk>
Source record: 219458

I posted the (what I think is the original) posting about the price of
the Falcon compared to the amiga.
I said the Falcon would be less than 600 English pounds.
Some people seem to think that I said 600 dollars and then decided the
Falcon would be 399 pounds. This is wrong!!!!

I've just found the article I posted to start with.
This comes from ST Review Issue 3.
"As to the Falcon, well we've all seen Commodore's A600, which is currently
retailing at 399 (English pounds).
^^^^^^^^^^^^^^^^^^^^ (399 for A600)
and next to the Falcon it's just a very poor games machine, and it
(the Falcon) can give most consoles a run for their money.
Add to this the fact that you get real computing power for
less than 600 (English pounds)
^^^^^^^^^^^^^^^^^^^^ (probably 599.99 pounds for Falcon)
it represents fantastic value for money.
I hope this makes the point clear.
Phil (E-mail naffara@uk.ac.crc)

850. Mouse Creep - solved at last!

Newsgroup: comp.sys.atari.st
Date: 1992-07-22 12:58:48 UTC
From: woocm@essex.ac.uk
Message-ID: <4627@sersun1.essex.ac.uk>
Source record: 219457

Well a few people asked me to post a follow up if I
sorted it out. Well i have at least it appears so. Firstly
someone suggested de-greasing the mouse pins, which I did
and it partially worked, so I opened the old STe up, and
had a look at the connections, I found a dry joint on one
of the pins! Re-soldered it and hey presto it appears to
be fine. BTW it is one of the very first STe's that ever
came out over in England, so it may occur on other early
STe's, can't see why may just be a coincedence!

Thanks for the replies, anyway.

>Bob Malay

I would guess it's probably the GNU readline library, which can be
compiled into command line driven programs to enable an emacs- (or
vi-) like line editor and command history. Software which uses this
interface (on the ST anyway) includes bash and the latest version
of gnuplot.

Cheers,
Si.

Hello,

Just updated "gemview.prg" version 1.1 to version 1.1m and have a problem.
The old version worked extreamly well in a 256 color mode on the crazy-dots
video card. Generated great pictures on a 21" Eizo grey scale monitor.

The new version only works in 1, 4, 16 colors under crazy-dots, if
I am in a 256 color mode, I get a window that should have the picture in
it, but really contains some scrambled pixels. Also in the 256 color mode
version 1.1m seems to ocassionly crsh the system.

Is there a bug in the version, or am I being stupid and not seeting a flag
in a setup menu or something?

cheers,
scott kolodzieski

Hmm, your reply is very confusing Roger... and i'm using the setup!!!

All you need to do is to use the cable that goes to the monitors
9 pin D connector, which, I believe, on the other end of it, has
the 23 pin connector to go into an Amiga.

I guess all you need to do is chop off the Amiga 23-pin D connector,
and wire up a plug for the ST/E

The Monitor itself, can run in digital or analog RGB mode, it has a
switch on the back of it for that, *only the one input socket*

It also has an RCA video input, and a chroma one as well, and
of course, the audio RCA jack/s.
Neat for hooking your video into to watch TV on your monitor!!! :-)

Craig.

>Bob Malay

I would guess it's probably the GNU readline library, which can be
compiled into command line driven programs to enable an emacs- (or
vi-) like line editor and command history. Software which uses this
interface (on the ST anyway) includes bash and the latest version
of gnuplot.

Cheers,
Si.

>bee" mouse pointer, and then GEM.PRG announces "Exit code 64538", ponders
>for a couple of seconds, gives me 3-4 bombs, and then resets the machine!

GEM.PRG starts up the GEM environment, which can only be done once in current
TOS versions. GEM is automatically started at MiNT boot time unless another
shell is specified in \MINT.CFG so there is no sensible reason for wanting to
start it up again, unless doing so would reinitialise GEM without crashing.

What I would definitely like to see is a way to quit GEM safely and release
its memory after it has been started. Then it would be possible to run GEM
programs at any time but not waste machine resources on GEM when it is not
needed. Rebooting to rid the machine of GEM is not an option.

Hello,

Just updated "gemview.prg" version 1.1 to version 1.1m and have a problem.
The old version worked extreamly well in a 256 color mode on the crazy-dots
video card. Generated great pictures on a 21" Eizo grey scale monitor.

The new version only works in 1, 4, 16 colors under crazy-dots, if
I am in a 256 color mode, I get a window that should have the picture in
it, but really contains some scrambled pixels. Also in the 256 color mode
version 1.1m seems to ocassionly crsh the system.

Is there a bug in the version, or am I being stupid and not seeting a flag
in a setup menu or something?

cheers,
scott kolodzieski

Message-ID: <H.JY6em0m4&eA@yonder.equinox.gen.nz>
Source record: 219476

I'm re-posting this as I don't think it got out the first time...

More problems.... can anyone tell me, does Hermes create an
incorrect path name, or have I got it set up wrong somehow...

From what I can work out, it's adding the sitename & the domain name
together from config.sys and making the From: and Path: fields
using this information.
My node is Yonder, and I feed off equinox (equinox.gen.nz)
This makes the from line read From:shore@yonder.equinox.gen.nz, which is
correct, but it also creates the following path
Path:yonder.equinox.gen.nz!shore which is wrong, it should only be
Path:yonder!shore is the way I have it setup causing this, or is
it the way the software has been written?

Thanks,
Craig.

From: cctony@sun1.mcsr.olemiss.edu
Message-ID: <1992Jul22.214234.28382@ra.msstate.edu>
Source record: 219478

I am trying to write a real synthesizer-type program for the ST.
I can build a wavetable, which consists of amplitudes, which then
is supposed to be sent to the sound chip and played, producing a
clear tone. Unfortunately, nothing seems to work.

I really need sources to a program which can play digitized sound
and the format of the files it sucks up. I can then tweak that
into being a backend for the wavetable generator, and presto! a
synthesizer. If I implemented MIDI in as a third step, I'd have
a MIDI-capable sampling synthesizer. After this, I could get a real
job in a field I'd love to work in.

Thanks in advance....

>Stop being a bigot Bill, the same can happen if you are using the old Zoo 2.01
>with new Zoo 2.1 files..

again you resort to namecalling. libelous namecalling at that (since i am not even a bigot).

i agree that zoo can cause some obscure problems with certain system configs. i am not, however, a bigot. zoo, however, does not pose any problems to anyone willing to use a CLI. it is possible to extract any non-corrupt zoo archive (and even most all corrupt ones). as the original poster pointed out, this is (as usual) not the case with lh5 archives. you have to assume there are people here that have just started reading this group and have no idea what version of LHarc is required for what .lzh file and may not even know there is (now) a unix version to handle the problem for the time being. note that with zoo, this is less of a problem because it works the same way on any system, be it unix, amigados, MS-DOS, or TOS. there is a de facto standard for zoo. there is none for lharc.

>Its like the help info in one of the Unix ports that I fond on A.A. it used
>the Unix text format with no CR, so is this the way that you freaks program
>so that you can't even list the help info in the ttp..??

this is not an issue. both lharc and zoo will merrily pack files without CR-LF sequences. it is just a feable attempt to again discredit users who prefer CLIs. insulting namecalling will get you nowhere real fast as well. besides, why on earth do you want to read docs for a program which is a unix port? stick with your desktop, mister. a unix user would know what to do here. are u actually suggesting that there are some unix utilities that are useful? besides, TOS and DOS share an ancestry with CPM. that is the only reason CR-LF is used on the ST. you want to discuss how "wacky" DOS is with 64k segment limits and a zillion programming models? LF-only is just as valid a line terminator as CR-LF as is VMS's method (which is totally unlike either, as i recall). all you need is to understand the difference to deal with text files from foreign sources.

if you had stopped to ask for a solution, any one of us would have gladly mailed you a program to convert LF to CR-LF. this would run from the desktop as well. it is so trivial (to a programmer) that it is hardly an issue. instead you prefer to call us "freaks".

>This was the tarz or compress program that did this, and was not the doc file,
>and why can't we have standard Doc files that we can list on the Atari as it
>stands, by using the desk top..??

what is tarz?
like zoo and lharc, tar/compress will NOT alter cr/lf. you are totally
wrong here. in fact if it did, it would not be tar (since there is an
international ISO and IEEE standard defining the behavior of tar).
the contents of the original file are left totally unmodified
(unless there is a bug in the program and having portable source for both
tar and compress allows you to fix any bugs you do encounter). i can quite
simply list the contents of any compressed tar file on the ST with from a CLI
that supports pipes with "compress -d file | tar tvf -". i can create an alias
for this in many CLIs (for example, a csh-like CLI might use something like:
alias x 'compress -d \!$ | tar tvf -') and then i only need type "x file<CR>".
exactly 7 keystrokes if you're keeping track. you can't do that from the
desktop at all, however, hence your disdain. surely you can't object to
typing 7 chars when you spend so much time typing notes to this group? or
do you "mouse" each letter from a menu? :-)

you can also replace the default file pager on the desktop to something more
rational like the (yuck) unix "less" program, if you bothered to read the
docs on the desktop.inf file. less will handle both LF and CR-LF terminated
text files without difficulty (at least my less does). as a CLI user, even
i know (and use) this desktop trick.

yell at the poster of the file who packed it that way if you want. don't blame
the archive program, be it zoo, tar, or LHarc. or call it a "bug" and we'll
fix it (if it is a bug and not just a misunderstanding or failure to read
the documentation).

>Also Bill you have been out voted here, so live with the fact..

funny, i must have missed the article with the results of this "vote".
i bet the original poster complaining about .lzh files would not get your
vote, however. it seems to me that there are far more "i have a problem with
this .lzh file" than there are "zoo is driving me nuts" posts.

i think it wise that you stop speculating about how unix works. there are
people here who have years of experience with it and would chew you to
pieces. best bet would be to remain silent on unix issues. you can talk
all you want on the desktop. just a friendly suggestion/warning...

i am curious as to how you actually interface to usenet. can you tell me
(or us) how you post notes here? what system is used as the interface to
the net? and what operating system does it run?

>better and easier for many users.

this is a reasonable request. i suggest that if anyone does attempt this, that they:

1) #ifdef the changes to the original source code so it can be easily recompiled without this feature. try and use "standard" library calls like chdir(2) rather than GEMDOS Dsetpath. you will find it more easily accepted if done this way (MS-DOS C compilers, unix, ST GNU C, and other systems all have a chdir function, hence it is more portable).
2) write it in C :-)
3) mail the changes to rahul dhesi (the zoo author) for consideration in future zoo releases.
4) keep the UI consistent with zoo conventions, both novice and expert modes. novice might be something like: zoo -ext -dir <dir> <arch>. i am not sure about expert mode since it should work from the desktop to be most effective. then again, it might be reasonable to assume that novice mode is more prevelant among desktop users (tho i myself use -ext more often than the "x" commands even from a CLI and i suspect others do, too). remember that the desktop is case insensitive in the .ttp dialog and i believe converts everything to upper case.

this would also be useful on any system, not just the ST. thanks for the idea.

> [re templates]

Templates DO work (to a certain degree, partially limited by the inexactness of the definition of the language).

If you RTFM, you'll see that you CANNOT "compile" a template. That doesn't make any sense. A template is a *template* for creating code, not the code itself. The usual procedure is to #include the .cc file of the "implementation" of the template. When you think about it, it's all pretty obvious (what is the compiler SUPPOSED to do with the uninstantiated template? - you get just what you get if you have a heap of #define macros but no actual usage of the macros - ie. nothing). This:

gcc -c templ.cc

Where templ.cc is all template "implementation", is the same as compiling the empty file (except it takes slightly longer, as the compiler reads in all this talk about what you're GOING to do, even though you never actally do anything).

So, try:

```
#include <Set.cc>

main()
{
Set<int> MySetOfIntegers;
...
}
```

Personally, I would prefer people to use the ".t" extension for the implementations of templates, but how would I ever get that?

Also, by now you've probably realized "Hey, but I'll get copies of the same code in every module that imports Set.cc", which will then clash at link time. Correct. The solution to this is beyond the scope of the language however - it is an environmental concern of how to only create one copy of an instantiation of a template. How can the compiler know what other modules.o you have written that have used whatever templates? The general solution, is to only #include the .h of the template (the definition) in every module of the project you are working on, then writing a single module that instantiates all the classes and templates you need. How you do this may range from simply seeing what link-time errors you get, through manual or automatic source-based analysis of what instantiations of a template you make, all the way to a more powerful linker that can generate, as an option, the module that instantiate all the missing implementations (this, I

believe, is the correct solution, but whose to write it...).

>
>You can't use the RGBI input...

Hmm, your reply is very confusing Roger... and i'm using the setup!!!

All you need to do is to use the cable that goes to the monitors
9 pin D connector, which, I believe, on the other end of it, has
the 23 pin connector to go into an Amiga.

I guess all you need to do is chop off the Amiga 23-pin D connector,
and wire up a plug for the ST/E

The Monitor itself, can run in digital or analog RGB mode, it has a
switch on the back of it for that, *only the one input socket*

It also has an RCA video input, and a chroma one as well, and
of course, the audio RCA jack/s.
Neat for hooking your video into to watch TV on your monitor!!! :-)

Craig.

Yes, this is Atari Advantage. There have been 2 issues so far; an April and a May. The June and July issues are to be combined and contain the first U.S. hands-on review of the Falcon. We are all looking forward to it! You should get it by the end of the month. It is a monthly publication normally, but they're new at publishing and they got a bit behind! The June/July issue will count only as one issue off your subscription.

Message-ID: <2178582@overmind.citadel>
Source record: 219153

I am trying to write a real synthesizer-type program for the ST.
I can build a wavetable, which consists of amplitudes, which then
is supposed to be sent to the sound chip and played, producing a
clear tone. Unfortunately, nothing seems to work.

I really need sources to a program which can play digitized sound
and the format of the files it sucks up. I can then tweak that
into being a backend for the wavetable generator, and presto! a
synthesizer. If I implemented MIDI in as a third step, I'd have
a MIDI-capable sampling synthesizer. After this, I could get a real
job in a field I'd love to work in.

Thanks in advance....

Source record: 219488

Hi there! I almost gave up on the cable... I have tried almost everything, but I still have the same problems... The last time I rewired it, I had all the wires hooked up properly, except the monochrome was tapped with one of the colors (like I did before with the blue), now it looks like I have all the colors, but I can't seem to get the screen from flipping up and down. The Horizontal and Vertical syncs are ok (never touched them after getting them right the first time), but the screen goes up at a fast rate that you can't tell what's going on!

Does anyone know of a company that I can contact or anyone that has put such cables together without problems, so that I can fix this problem?

Randy,

You must be referring to Atari Advantage magazine. I received the April and May issues okay, but June hasn't shown up yet. The reason is that they wanted to have a Falcon preview (review?) in the June issue but the information came too late and they decided to create a June/July issue. You should have it this week or next. Thats what someone at Atari Advantage told me.

sheppard_r@kosmos.wcc.govt.nz writes:
>Stop being a bigot Bill, the same can happen if you are using the old Zoo
2.01
>with new Zoo 2.1 files..

again you resort to namecalling. libelous namecalling at that (since i am not
even a bigot).

i agree that zoo can cause some obscure problems with certain system configs.
i am not, however, a bigot. zoo, however, does not pose any problems to
anyone
willing to use a CLI. it is possible to extract any non-corrupt zoo archive
(and even most all corrupt ones). as the original poster pointed out, this
is (as usual) not the case with lh5 archives. you have to assume there are
people here that have just started reading this group and have no idea
what version of LHarc is required for what .lzh file and may not even know
there is (now) a unix version to handle the problem for the time being. note
that with zoo, this is less of a problem because it works the same way on
any system, be it unix, amigados, MS-DOS, or TOS. there is a de facto
standard
for zoo. there is none for lharc.

>Its like the help info in one of the Unix ports that I fond on A.A. it used
>the Unix text format with no CR, so is this the way that you freaks program
>so that you can't even list the help info in the ttp..??

this is not an issue. both lharc and zoo will merrily pack files without
CR-LF sequences. it is just a feable attempt to again discredit users who
prefer CLIs. insulting namecalling will get you nowhere real fast as well.
besides, why on earth do you want to read docs for a program which is a
unix port? stick with your desktop, mister. a unix user would know what to
do here. are u actually suggesting that there are some unix utilities
that are useful? besides, TOS and DOS share an ancestry with CPM. that is
the only reason CR-LF is used on the ST. you want to discuss how "wacky"
DOS is with 64k segment limits and a zillion programming models? LF-only
is just as valid a line terminator as CR-LF as is VMS's method (which is
totally unlike either, as i recall). all you need is to understand the
difference to deal with text files from foreign sources.

if you had stopped to ask for a solution, any one of us would have gladly
mailed you a program to convert LF to CR-LF. this would run from the desktop
as well. it is so trivial (to a programmer) that it is hardly an issue.
instead you prefer to call us "freaks".

>This was the tarz or compress program that did this, and was not the doc
file,
>and why can't we have standard Doc files that we can list on the Atari as it
>stands, by using the desk top..??

what is tarz?
like zoo and lharc, tar/compress will NOT alter cr/lf. you are totally
wrong here. in fact if it did, it would not be tar (since there is an
international ISO and IEEE standard defining the behavior of tar).
the contents of the original file are left totally unmodified
(unless there is a bug in the program and having portable source for both
tar and compress allows you to fix any bugs you do encounter). i can quite
simply list the contents of any compressed tar file on the ST with from a CLI
that supports pipes with "compress -d file | tar tvf -". i can create an
alias
for this in many CLIs (for example, a csh-like CLI might use something like:
alias x 'compress -d \!$ | tar tvf -') and then i only need type "x
file<CR>".
exactly 7 keystrokes if you're keeping track. you can't do that from the
desktop at all, however, hence your disdain. surely you can't object to
typing 7 chars when you spend so much time typing notes to this group? or
do you "mouse" each letter from a menu? :-)

you can also replace the default file pager on the desktop to something more
rational like the (yuck) unix "less" program, if you bothered to read the
docs on the desktop.inf file. less will handle both LF and CR-LF terminated
text files without difficulty (at least my less does). as a CLI user, even
i know (and use) this desktop trick.

yell at the poster of the file who packed it that way if you want. don't
blame
the archive program, be it zoo, tar, or LHarc. or call it a "bug" and we'll
fix it (if it is a bug and not just a misunderstanding or failure to read
the documentation).

>Also Bill you have been out voted here, so live with the fact..

funny, i must have missed the article with the results of this "vote".
i bet the original poster complaining about .lzh files would not get your
vote, however. it seems to me that there are far more "i have a problem with
this .lzh file" than there are "zoo is driving me nuts" posts.

i think it wise that you stop speculating about how unix works. there are
people here who have years of experience with it and would chew you to
pieces. best bet would be to remain silent on unix issues. you can talk
all you want on the desktop. just a friendly suggestion/warning...

i am curious as to how you actually interface to usenet. can you tell me
(or us) how you post notes here? what system is used as the interface to
the net? and what operating system does it run?

Hey guys, I've not commented so far, but I *think* the original discussion was related to worries that even I have:

I have used FONTVERTER to convert literally hundreds of Public Domain Mac fonts (mostly from the Nautallus CD's, a great source of postscript fonts!). I am concerned that these fonts may not work with Calamus SL. If that were true, it would render Calamus SL virtually useless to me, because other than the original fonts that came with Calamus, the only two packages I have purchased have been Cherry Times and Cherry Garamond. That would severaly limit my creativity...

So, does anyone know if these fonts work with Calamus SL?

>Is it possible (has anybody tried this?) to use Mint and Gemini at the same time??
>Can Mint startup Gemini??

Yes, I it works fine. The only Problem is, that Gemini does not know about starting TTPs as parallel processes. So, if a TTP runns, the Desktop sleeps, as known from Gemini + TOS. Starting a TTP as background process (with "bg") is of course possible, but this causes other problems: The build-in Mupfel-Shell occupies the console-window and you can not stop it because otherwise the whole Desktop is stopped again. So background process and Mupfel output will be mixed on the Screen.
Another problem: The Gemini console-window output-routines are not fully multitasking proof. They seem to assume to work in the top-window. This may mess up your sceen, if a background process writes to the partly covered console.
Of cause you may use BG.ACC to work with a number of parallel processes, but them you will not be able to use all of the benefits of Gemini. But I heard rumours, that there will be a new fully-mint-aware version of Gemini in the near future. In addition I am working on a Gemini-aware xterm clone-DA that will also solve the problems mentioned above. I will be free and I will anounce it as soon as it is ready.

Hello,

try Turtle V 3.x. You will get a backup on disk with the original file structure of the HD. Turtle makes file backups and no image backups. Not long ago i used the turtle-programms tramdisk and ttlexec with an cli. That offers me plenty more functions than the normal gem-shell. I'm sad that turtle won't work on my TT

bye

You can make a Spectre partition as large as you want, preformat it as BGM
and than convert it into HFS. This does not belong to your GEM driver
software, e.g. if you're using ICD or AHDI or what else. The format identifier
of the Spectre partition then is "OOP".
Concerning DOS partitions, my first idea is the DOS version you are
using. Be sure to use 4.01 or later, I remember there were problems
formatting large partitions with former DOS versions.

Regards,
Markus.

>:
>: Thanx in advance . .
>: ^

I have a 520 STE w/ 4 meg. I'm informed that SST doesn't work on 520/1040 STE's. First, of course, due to physical space restrictions. This can be overcome by putting it in a tower case (I haven't done this). Second, there is some other problem that prevents it from working. I don't think the Megas suffer this restriction. My own opinion is that if the price difference isn't large or important to you, go with the MEGA. It seems to be more versatile (VME and Graphics cards, etc., Internal SCSI?). There doesn't seem to be much of an upgrade path for the 520/1040 STE's.

This is of course, just my opinion. Do with it what you will.

Is it possible (has anybody tried this?) to use Mint and Gemini at the same time??
Can Mint startup Gemini??

Bob Malay

I've experimented with this, and it works fine. I have MiNT in \etc,
using MINT_IT. MiNT starts up GEM, then I have Gemini installed under
the TOS 1.4 desktop to auto start.

I now use init and login, but the setup with Gemini worked fine. The
only problem was the inability to use the job control keys with bgacc,
and of course that MiNT's debugging output trashes a GEM screen if you
use it.

Gemini is good program (well written) !
MiNT is a good program !

So there are no problems: Gemini works under MiNT !
But don't expect Gemini (at least until the new version comes out)
to use the special features of MiNT !

MINTSHEL is a `pure' shell which, unlike Gulam or Mupfel, doesn't have any builtins commands except those absolutely necessary (like cd, which must be builtin). You need some additional utilities, like Alan Pratt's MiNT utils or the GNU file utilities.

> 2. Did anybody use Pure C with the MiNT libraries, does this work.

Read something about that in the MausNet during the few weeks. I believe several people are actually porting the MiNT library to Pure C. The main difficulty seems to be the use of inline assembly.

You are right. GemView Versions later than 1.1i April-08-1992 are buggy and
do not work correctly on graphics boards.
Please use the April-08-1992 Version. It works fine on my Spektrum graphic
board with 256 Colors, HighColor and TrueColor.

I have also experienced this problem. The cause is the litte SMD chip inside
the mouse, if I remember correctly it's just a simple 74LS... type that likes
to fail in a whole batch of ST mice.

If you're good at soldering, replace it. I bought a "refurbished" mouse.

You are referring to the Atari Advantage magazine. Their first issue was April, the second issue was May (your first issue). The third issue (June?) should be in distribution sometime this week. (This is allegedly the issue with the Falcon review.)

I was concerned about the same thing as you (i.e., what happened to my subscription?) and sent them mail on GEnie. I received a response providing the above information. In my case, he promised to send out my issue first class this week (so they are responsive).

In an interesting side note, the *July* issue of ST-Informer has a very professional editorial by Rod McDonald describing his view of the split without naming any names. One of the observations that he made in the editorial was that the two individuals that left did not seem to understand the importance (in Rod's opinion) of getting issues out on time. :-)

I have also been having a subscription problem with Atari Explorer and it *appears* that ST Connection is no longer in production. (I received two issues out my six-issue subscription.) After all of my problems get sorted out, I think I am going to do myself a favor and subscribe to AIM (Atari Interface Magazine). I buy it on the newstand now and I think that Bill and Pattie Rayl deserve our support. (Incidently, IMHO the sharpest AIM cover that I have seen was the DTP issue with the tan brick background. Very catchy!)

The Maze Editor comes with the registered version of MidiMaze II. Only the registered version is capable of loading user defined mazes (i.e., the shareware version is only capable of loading the mazes that come with the game).

On a related subject:

I heard that Sigma Soft (producers of MidiMaze II and TurboAss) quitted supporting Atari. Can anyone confirm that?

There's a new thing called TT Touch. It got a favorable review in the
May Atari Advantage magazine. You have to disassemble your keyboard to
install its little pieces, but it didn't sound too difficult. I think the
price is something like $44.95. Your dealer or Best Electronics should have
it.

BTW, in the August 3 issue of Forbes, there's a pretty good analysis of
Atari Corp. and its problems. It must be read by everyone concerned about
Atari's well-being, whether you own Atari products or not.

Yes, yes, it's coming. You should get it any day now. I haven't gotten mine either, but they've been shipped. It has the Falcon pre/review in it.

Apparently, it's been labeled the June/July issue, but you will still get 12 issues to your subscription.

That matches my experience too. They sent it to me for free for a
while (I guess because I sent them some disks of stuff) and when I
finally decided to make myself an "official subscriber" and sent them
money for a two year subscription, I soon stopped getting issues!

>< Gemulator board. Mac emulation is definitely planned for a future release.
>
>Of course, this will not allow reading of Mac disks, like Spectre GCR.

1/2 BUZZ! Check your facts. PC drives aren't capable of reading Mac 800K disks
but they are quite capable of reading Mac II 1.44 meg disks. There are several
commerical programs available for the PC that do exactly that - read and write
files to Mac disks. The only reason that Spectre GCR has to use the extra
cables is to read 800K disks, since STs do not come with 1.44 meg drives.
Most PCs with 3.5" drives are using 1.44 meg drives.

What's so strange about this ? Atari has been manufacturunig PC clones
for>Thomalmost five years now.We have one in our firm and it's
working very well (for a Messy-DOS machine, that is).

924. Any luck with UNIX Windows?

Newsgroup: comp.sys.atari.st
Date: 1992-07-23 21:12:54 UTC
From: cctony@sun1.mcsr.olemiss.edu
Message-ID: <1992Jul23.211254.6151@ra.msstate.edu>
Source record: 219414

Hi!
Has anyone had any luck with the UNIX Windows package available
on atari.archive? I ftp'd the whole schmeer, and compiled the
stuff on my Sun (with IPC enabled in the kernel) and ran the
server. I then ran the WIN.PRG program on the ST, configured
the baud rate, and WHAM! No luck. :)

Any takers? I can't make it work, and I'd love to have this
operational. If anyone wants the techniques I had to use
(i.e. a forward of the e-mail that makes it go) lemme know
via e-mail.

Thanks a pile,
Tony

It just may be that this question is answered in the FAQ. :-)
Unix Windows runs only in high resolution, even though it doesn't give
any errors indicating that if you run it in another res.

>So, does anyone know if these fonts work with Calamus SL?

The folks at DMC don't appear to like competition, so they keep adding
various checks to newer versions of Calamus and Calamus SL to make these
programs reject third party fonts. Fortunately, there are workarounds for
most of their little tricks.

I beleive SL refuses to load fonts that have the string " Postscript"
in the header, so a simple letter change can fix any font converted
from postscript which puts this in the header. Use one of the many
available hex editors to change the files.

Be sure to write to DMC to tell them how much you appreciate this
little "feature" when you're done.

BTW, a similar change to block the loading of Cherry fonts cost the
owner of that company over $500.00 to fix and mail out upgrades to all
his registered users. Just the kind of expense a small company needs to
survive.

927. pc ditto

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 00:31:55 UTC
From: mike@r-node.gts.org
Message-ID: <1992Jul24.003155.8348@r-node.gts.org>
Source record: 219429

I had been trying to get pc ditto ver 2.0 to run on my st.

Well thanks to all who suggested it might only run in color.

I hooked an rca cable to an old 'game' box I had (from my C64 !) to
my color tv, and at least I can see what the program msgs are.

I had been wanting to try my ST with the video jack anyway, and this was
a reason to try it (I also managed to find the 'game' box <g>)

Well, I have tried it with MSDOS 5.0 and MSDOS 3.0.
(both formatted boot disks)

I get the message 'possible disk error'.

The disks are fine when read from GEM.

I saw a post recommending PC DOS. Is this what I need?

If you use rn or trn, change the /some name/h:j to /some name/a:j
in your killfile.
This will search the entire article, rather than just the header, thus
any occurance of the string will cause the article to be junked.

I don't think I saw it the first time, so maybe it didn't
make it out. There is a bug in Hermes which will cause your
.X and .D files to go out of sync. Get 1.03
Check your uucico log file to see if your mail batches
are getting out of sync.
>
>More problems.... can anyone tell me, does Hermes create an
> incorrect path name, or have I got it set up wrong somehow...
>
From what I see, unless you are a registered domain, hermes is
creating a proper Path. Yonder is a subdomain of equinox, isn't
it? Thus you are yonder.equinox.gen.nz!shore, according to my
understanding of rfc 822. This format should not cause any problems
as far as I know with any version of C news currently running.

What exactly is your problem with the Path generated? My path is
generated the same way, and it has never caused problems in followups
or propagagtion.

You can also just change the resister biasing the photo transister
who's bias tend's to drift with age. However, the best solution is an
aftermarket mouse, like the Golden Image GT 250, which has microswitches
and in general is a much nicer feeling mouse.

More details should be available by the end of this week, when
Atari Advantage arrives to people who paid for first-class delivery.
Contact AA at 70007.3615@compuserve.com or call (503) 476-3578 for
more info. Other Atari magazines should provide more coverage soon.

Fast Tech ('030 accelerator designers) recently offered an *incredible*
tidbit when they said that 33 mhz '040 boards in various configurations
could be installed in the Falcon. Pricing was estimated at $399 to
about $1200! If they can actually deliver them, the Falcon would
have the firepower to send a missile up Apple's arsenal methinks.

=DC=

One more thing...a new dealer called Steve's Software said they'd
be carrying the Falcons. Currently they handle ST, Portfolio and
Lynx merchandise. Below is some info about 'em.

[HOURS]= Monday - Saturday 8:00a.m. - 10:00p.m. (PST)
CLOSED Sunday, BUT call anyway, if we are here we will
be glad to help!!!

934. HELP! My ST doesn't work.

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 04:40:07 UTC
From: riana@acca.nmsu.edu
Message-ID: <1992Jul24.044007.12079@nmsu.edu>
Source record: 219427

HI. I need some help. My computer seems to be upgefucked.
In a nutshell, I have an atari ST 520. I used to burn it (leave it
running, that is.) Then I moved away from home and did not bring it with me.
It sat, off, for about six or eight months. When I got it back, none of my
programs would load (I had rogue, degas, wordwriter st, basic, sundog,
apshai trilogy, and a few others. Mostly I used it for degas.)
Everytime i tried to load them I either got a 3 bomb or a #35.
I left the computer at a freinds house for about two more years, having
given up on it. The preferences would load, and GEM seemed to work fine,
but nothing that ended with .prg seemed to want to load.
I just got it back, and it is still screwed. Knowing a _little_ bit
more about computers, nowadays, I decided to see if there was anything I
could figure out about it. I cleaned the heads oon the drive, and that
didn't help. I got another copy of degas, and that didn't help. The new copy
gave me the "this program doesn't want to work" message the first time, and a
#35 the next (not to mention, it wouldn't boot without me booting another disk,
I tried the rogue at another freinds house, and it gave me a #35.
I found this extremely odd, since it seemed to indicate that it was
the disks that were screwed, but the copy of degas, which was made in another
computer and worked fine there, wouln't run, which indicated it was a drive
problem.
So, I took the drive out of an agima, plugged it in (since the con-
nectors inside are the same) and tried it again. The degas copy wouldn't
boot, so I booted it off another disk and loaded the degas. it gave me
a #35. (when i tried to boot the degas disk, it gave me a three-bomb guru
meditation). I tried to load the rogue disk, and, of course, it was screwed
with a #35, still.
Since the (annoyingly noisy) agima drive was KNOWN ahead of time to
work, I have come to the conclusion that it is probably the computer itself,
and not the drive or the disks (although the computer could be messing up
the disks, presumably. I am writing agima backwards so no ones kill
files catch it, by the way, as i have to get this post to as many potential
troubleshooters as possible.
As it is, Irving 9my st) is sitting with the case off, so the next
CEE major that comes by can look at it without me having to re-unscrew it.
Hopefully, living in a colege town, I can get this thing working without
having to pay anyone anything, as i cannot afford it, but any help anyone
can give would be most appreciated. I was a teenager when i got it, so
those warranty forms never got sent in.
If anyone knows anything about this sort of thing, please help.
I cannot respond to mail due to a /tmp problem here, but i can respond from
dodger@bigboy.cis.temple.edu
thanks, in advance
DODGER

935. Faulty Ghostscript 2.41 diffs.

Newsgroup: comp.sys.atari.st

Ah... but call up IB Computers and find out if they actually have any Atari PCs in stock...

After literally YEARS of TALKING about entering the PC market in the US, an article in Current Notes recently reported on this year's Atari Stockholder meeting, and one of the interesting things to come out of it was that Atari has dropped their line of PCs in the US.

BobR

938. Latest version of OPUS, where is it?

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 07:00:59 UTC
From: cpr@dde.dk
Message-ID: <1992Jul24.070059.30840@dde.dk>
Source record: 219265

I have been looking at OPUS and it seems to be a better spreadsheet
than the old version of K-spread that was bundled with my machine (the
integrated graphics package really looks nice).

I would like to know what is the newest version, and also if the
author has an e-mail address. I have tested version 2.2 and managed to
install it correctly by means of the installation docs, but I miss the
documentation for OPUS itself (the docs only point out differences
between version 2.2 and 2.1).

Thanks in advance...

Claus

PS. I have owned an Atari ST 520STM for 5-6 years by now, added some
extra memory, new ROMs and a harddisk, and during that period I have
been running a window operating system, various unix-like shells and
other unix/GNU software - and I am quite happy with that.
During the same period some of my friends have owned PC XT's,
then 80286 AT's and now they have to go out and buy at least a
80386 in order to run a window operating system - and still, some of
their favorite software seems to think that 64K bytes is all the
memory you will ever need. I DO NOT think I need to point out who has
paid the highest price; even though each of their taiwan-clones probably
where a little cheaper than my ST, it all adds up in the end.

There is a shareware program called FASTGIF that will convert a GIF
to a .PI1 file, and from there, I suppose you can load it into
Degas, and then save it as a .PI3.

940. Printing from Atari ST to Apple LaserWriter

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 08:46:29 UTC
From: johnr@cged.co.uk
Message-ID: <1992Jul24.084629.16276@cged.co.uk>
Source record: 219160

I have an Apple LaserWriter IINTX plugged into my serial port on a Mega ST.

It prints PostScript files perfectly as long as I follow this
procedure:

1. Make sure the printer settings are right in the Control Panel.

2. Switch the printer on, and wait for it to get ready.

3. Print the file.

However, after printing the file, the printer light continues to flash as
though it is receiving more data. If I try printing another file
immediately, nothing happens.

I suspect the file is not being terminated properly and the printer is
waiting for something. The end of the file looks like this:

```
showpage
grestore
%%Trailer
```

Eventually, after several minutes, the green light stops flashing and I can
print something else - presumably, the printer timed out.

Also, if I switch the printer on and then alter the printer settings using
the Rho Control Panel, the green light starts flashing as though
something has been sent from the serial port.

I am using XON/XOFF, 8 data bits, 1 stop bit, 9600 baud, TOS1.4. The
handshake seems to be working fine.

Can anyone suggest what is happening and how to fix it?

945. New freeware sequencer for ATARI-ST released

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 10:42:58 UTC
From: eker@loria.crin.fr
Message-ID: <374@muller.loria.fr>
Source record: 219430
Cross-posted to: comp.sys.atari.st,comp.music,rec.music.synth

I've just released version 1.1 of my freeware sequencer "EKSEQ1" for
the Atari ST(e).

Feature list:
o GEM based, colour/mono, only 512K RAM needed.
o 100 tracks, 240ppqn.
o Multi-track recording using separate MIDI channels.
o Soft-thru with optional channel switching.
o Realtime note-on event graphs for Midi in/out.
o Copy and move operations with replace, merge and multicopy options.
o Quantise, randomise, transpose, invert and erase operations
which can apply to chosen range of time and/or tracks.
o All operations can be modified by MIDI filter.
o Graphic editing.
o Event list editing.
o All operations/editing multi-task with record/playback.
o MIDIfile compatible load/save.
o MIDI mixer allows volume to be set for each channel during playback.

Availability:
I've uploaded it to atari.archive (ftp: atari.archive.umich.edu)
& emailed it to the moderators of comp.binaries.atari.st (the USENET newsgroup)
& the cs.ruu.nl archive (ftp: archive.cs.ruu.nl, mail-server:
mail-server@cs.ruu.nl).

1st: Did you ever try to run Turbo ST on non-standard resolutions like
Overscan? It doesn't work --> put it into the shredder.
NVDI replaces the vdi screen driver, which is the one and _only_ (!!!) clean
way of implementing a screen speeder. Unfortunately, NVDI is the only of 'em
that does it the right way, as I know.

Additionally: There's no reason to hate GDOS if you don't mind working with an
ATARI, generally.

Regards
Patrick

947. CLA...

Forgive me for wasthing bandwidth. I think someone had mentioned running CLA (I forget the actual filename) - the program that does the simulated circuit design, and getting a TOS #53 error. I tested it out and here's what I found. When you extract the file, make sure you have the "Include Subdirectories" switch on (as in Arcshell, or the proper switches from the command line). If you don't, everything goes to 1 directory, the program can't find some of the files, and Error. But with the subdirectory switch turned on, the files go to their right places, and it works.

I personally haven't used it too much (am not an expert on circuits), but I did find it cool that it ran under a Monochrome emulator on my TV (my multisync is being fixed). Hope this is useful to some people...

Rudi, do you happen to have the article in C't magazine on the OMTI hard drive adapter/controller. Did it have a template for the circuit board as it is no longer available to buy? If you have the article would I be able to get a photocopy of the article and what address do I write to? Please help me if you can. Thanks in advance. Tony Lewis from Down Under in New Zealand.

Nope, this is an add for high resolution. Looks like I'll have to
drag out the old multisync and cram those little wires in the
monitor connector again :).... Thanks!

951. Re: Falcon price and poss. release date?

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 14:03:55 UTC
From: kort@fwi.uva.nl
Message-ID: <1992Jul24.140355.14865@fwi.uva.nl>
Source record: 219435

Well I did see an add saying:
--> ATARI FALCON 030 **(NL)** f 1498.00
(fl 1498 is about $750)
But since it was only one small line in a long list of other products,
and there were no specifications, not even how much ram,
I'm not sure what I'm supposed to make of it. The
nl means it's dutch (don't know what's dutch about it though).

952. Falcon again!

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 14:05:41 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Jul24.140541.29237@crc.ac.uk>
Source record: 219434

More info about the Falcon again!
(This time from ST Format)

The Falcon will have a 1.44 Mb drive and will be in the same case as an 1040 STE. It will also have a SCSI 2 port rather than DMA. (can anyone tell me what the difference is between SCSI and SCSI 2?).
It will have a 10-channel 16-bit sound chip (this doen't mean much to me because I no nothing about music!) with MIDI In and Out, with Through being available via the Out port.
Graphics should be good with 30 screen modes, 16 million (!!!!!!!) colours.
RAM will be upgradable to 16 megs (don't know what it will start at).
It will be more compatible with the ST than either the Mega STE or the TT (good news to me!)
The processor will be a 68030 (speed unknown) with a Motorola DSP56001 chip. This will make the thing run much faster so I'm told but again I have no idea about this kind of thing.
All this and probably more for only 550 English pounds. (note the English :-)
Phil
E-mail naffara@uk.ac.crc)

953. Falcon info

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 14:36:14 UTC
From: kort@fwi.uva.nl
Message-ID: <1992Jul24.143614.15665@fwi.uva.nl>
Source record: 219437

```
Hardware:
16 MHz MC68030
32 MHz Motorola 56001 DSP-chip
1,4 or 16 MegaByte (No simms ...)

External connectors:
parallel port
serial port
SCSI II-port
Video out/Genlock
stereo headphones-out
stereo mike-in
DSP / Digital audio interface
RF-Modulator(TV)
LAN-port

Cartidge ROMport
Joysticks
MIDI-In
MIDI-Out

ST-joystick / mouseports

Intern
DRAM expansion board
Internal bus expansion-slot
Internal IDE harddisk-connection
Internal diskdrive

Resolutions:
Mode Resolution Bitplns colors pallette
ST Low-res 320x200 4 16 4096
ST Med-res 640x200 2 4 4096
ST High-res 640x400 1 2 4096
640x480 8 256 262.144
true color 320x200 15 32768 --
VGA/VIDEO x:320 or 640 1,4, 2,16, (overscan select)
y:200 or 400 8 256 262.144

The DSP can do a 1024 point complex Fast fourier transform in 2.07
milliseconds. The TT with coprocessor needs 145 milliseconds.

Since the DMA port has been removed you can't use the SLM 804 and 604

The IDE connector allows you to connect a cheaper IDE-harddisk.
```

P.S. I got all this information from a magazine called "atari st nieuws" edition 50/51. There's lots more info in the article (especially about the DSP). I'm not gonna type all that stuff though :)

The SST won't fit in a Mega STE either. You need a Mega ST or, as you said,
a tower case. It's been mentioned a couple of times before from the designer
George Richardson, that there would a Mega STE version, but it would sacrifice
some of the features in the Mega ST version. And don't expect any time soon,
if at all. I think Dave Small has enough on his hands right now that he
doesn't need to worry about having George design another version.

>background. Very catchy!)

I've been strongly considering an AIM subscription as well. I'm on my last issue of Current Notes and I don't think I'm going to renew it. Dave Troy's articles are the only good, consistent ones in there. The rest is filled with rumors and incomplete reviews, although Joe's OCR review was pretty good, but they are few and far between. It doesn't deserve $27 per year in my opinion. I've heard good words about AIM, so I'll give them a try next.

I believe there was a mention on GEnie from the publisher of ST Connection that he was having some job-related problems and that's why there hadn't been any issues out.

958. SHIP program in AHDI?

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 17:07:51 UTC
From: bigham@hercules.acpub.duke.edu
Message-ID: <4070@news.duke.edu>
Source record: 219442

The documentation for both the AHDI disk that shipped with my Mega STe and the AHDI 5.00 package I recently grabbed from comp.binaries mention a program called SHIP.PRG whose purpose is to park the heads of all attached SCSI drives. Neither actually has it. Is this program available elsewhere, or is the documentation just zeebed? [PS. I know I can do this from HDX, but SHIP sounds easier to use for this particular purpose.]

>not the 33mhz '040 accelerator... right?

Probably not. This is about the right price range for a set of accel-
erator options - $399 for the main board, more for the board+33MHz'040, $1200 for (maybe) board+33MHz'040+cache+memory or something like that - I've seen similar configurations for accelerators on the Mac. Remember, that 33'040 is one _expensive_ chip. Of course, the accelerator range may take into account a lower model that has a 32MHz'030.

Remember take this with a salt shaker, as it is all speculation anyway. Heck, until it is announced, the Falcon is speculation too (its just gotten a lot of free press before it is born :).

Source record: 219445
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I Have a working single sided drive for an Atari ST computer-
Model SF 354 that I want to sell.

I know not many people like single sided drives, but it is
adequate if you have only one drive now. Otherwise you
may want the power supply (Same one for SF314 and
SF354).

It works fine-just a few minor enclosure mods were made, as
I was going to convert it into a 2 Sided, but decided not to.

I will also throw in a defective SF354 Single sided drive
mechanism too, for FREE if you want to try to repair it.

I want $35 for the one working drive, with cable and power
supply and the dead drive mechanism. Shipping included in the
U.S. Please reply E-MAIL to

962. Re: Modifying NES lightgun for Atari 2600/7800 - need help

Newsgroup: comp.sys.atari.st
Date: 1992-07-24 20:50:54 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <J4oFoB1w164w@cyberden.uucp>
Source record: 219179
Cross-posted to: rec.games.video,comp.sys.atari.8bit,comp.sys.atari.st

Here's what ANTIC says about the Sega gun being used on the 8-bits.

from: "First Look Inside the XE Game System," ANTIC V7,#4, Aug.1988, p.42

"..If you're tired of waiting, you may wish to pick up the Sega light gun
for about $25 (when on sale) and modify it for the Atari.
" To modify the Sega gun for the Atari, you'll have to cut off the
incompatible connector. The wires must be stripped back and soldered
into an Atari joystick connector as follows:
SEGA GUN ATARI JOYSTICK PORT
Blue wire Pin 1 stick FWD
Gray wire Pin 6 trigger
Green wire Pin 7 +5 volts
Black wire Pin 8 ground
" Because of the close-fitting connections for the XEGS ports, don't
wire in a DB9 female connector that has "ears." Most joysticks don't
have wires for unused signals, so cutting up an old joystick may not
work. Specifically, an Atari joystick does not need the +5 volts, so
there isn't likely to be a wire connected to Pin 7. Howeverm you can find
joystick extension cables at Radio Shack [I don't think this is true
these days...check MCM Electronics...], which have all nine pins wired
from male to female. [...Antic disclaimed responsibility for damages or
deaths...hehe]
" Once it's all hooked up, you'll notice that the gun fires when you
/release/ the trigger, which is annoying. The Sega trigger wiring is the
opposite of what the Atari light gun uses. To rewire the trigger switch,
remove the five screws (one is under the Sega logo on the side). Find the
trigger micro switch with three connections. Wire to the normally
/closed/ contacts instead of the normally open."

There ya go. Sounds like a bit of work, but I suppose it's worth it.
Does anyone know if the Genesis has a seperate light gun and if it works
identical to the Masters or what??

later

"Be seeing you!"

>nice little program that replaces the boring grey background canvas
>of the TOS desktop with a Degas-picture. Converting .gif to Degas
>would render an almost infinite number of possible backgrounds, since
>there must be thousands of gifs around.

One option I played with a few years ago is to use one of the two or three screen-capture utilities in combination with a monochrome GIF display program such as giffer (the one I tried) or mgif (haven't tried) to get your Degas image. The Degas image being a pretty straight write of the screen, the screen-capture utilities I saw used Degas format.

This has the advantage of generating a PI3 image, rather than trying to create one from a PI2 or PI1.

It was a couple of years ago, so I don't remember program names. They are available from atari.archive.umich.edu. Giffer is also available from comp.binaries.atari.st archives.

> Do I need to get some utilities which should be put in a bin directory

Exactly that. You should use the GNU file utilities (for pwd you only need
`alias pwd cd').

> 2. Did anybody use Pure C with the MiNT libraries, does this work.

After quite a number of changes, it does. A Pure and GNU C compilant version
of the MiNT lib is available as pcmntl20.zoo from athene.uni-paderborn.de
and ftp.uni-muenster.de

> >Of course, this will not allow reading of Mac disks, like Spectre GCR.
> Why wouldn't it?

The Spectre GCR cartridge contains some simple hardware to allow ST drives to read MAC floppies directly. The basic ST drive cannot read MAC format directly (software only) as far as I know. This is one of the major differences between Spectre GCR and the previous Spectre 128, which could not read MAC format.

Darek Mihocka has informed me in email that the Gemulator board will support reading MAC disks, but using different techniques. He claimed that IBM drives can read MAC disks directly (software only required). This is news to me, since I thought there wasn't much difference between ST floppies and IBM floppies, but that's what he said, and that there are several IBM programs that let you read MAC floppies. I guess we will have to see what happens when Gemulator is released, which is apparently soon.

>doesn't need to worry about having George design another version.
>

Also remember that there is the Tiny Turbo 030 accelerator, which _does_ fit
in a Mega STe or a Mega ST or an ST or an STe. It has loads of options
and I'm sure would be a dazzling upgrade for those not wanting to buy a new
system. I don't think you need a tower caser for any version of the
Tiny Turbo, hence the name. I imagine a Mega STe with a Tiny Turbo 030
installed would zip right along, so you have a machine that is a TT
except for the nameplate... :-)

I installed one of these in my STe last fall. You get a little baggie of some
94 or so replacement rubber caps. Needless to say, it's somewhat tedious to
install. (Not to mention the 26-or-so screws that hold the keyboard itself
together.) But aside from the tedium it isn't all that difficult, and does
feel a bit better, i.e., it's definitely better than that totally mushy feel
it had before.

I have a friend that has made a sampling synthesizer for the STE/MSTE/TT.
I takes MIDI input. He has also patched PRO24 and Cubase so you can play
MIDI-songs directly. He have 4/8/12/16 channels in 25KHz in polyphonic.

If you want to hear how it sounds like, download dynamite.lzh or dynamite.arc
from a.a.u.e or ftp.uni-kl.de, or mail me with a request.

Greets,

I am running mint on my harddrive. I have it all on partition H. I am also running the init package with mint. I use bash as my shell. I am having a couple of problems. First I cant seem to set up a symbolic link from h:/mgr to u:/mgr. I am doing this from within mint.cnf as follows.

sln h:\mgr u:\mgr

The thing that is odd about that is that my other links work fine.. Is there a reason for this? The other links I have a h:\bin u:\bin, h:\gnu u:\gnu, etc.

Now onto other problems. I startup mgr with no problems, but I cant seem to run mgrterm? It starts up, but then doesn't seem to do anything. Is there anything special that has to be done. Also how can I shutdown mint from within bash? With tcsh there is an alias "shutdown kill -TERM 1" or some such, is there a way to do this from withing bash? I cant seem to use kill at all from bash? Also the mintbash.zoo the latest version of bash?

John

> Bob Malay

>I've experimented with this, and it works fine. I have MiNT in \etc,
>using MINT_IT. MiNT starts up GEM, then I have Gemini installed under
>the TOS 1.4 desktop to auto start.

Just want to add a few caveat's:

1. Running GEMINI with MiNT (0.93 or newer), you may occasionally
crash the system by hitting Ctrl-C (to close a window). This
is reproducable, when Gemini comes up, i.e. with the console window
closed. If you try to close a folder window then, the system crashes
immediately.

2. If you press ESC while looking at a Gemini Window (to update
the directory contents), and you have a background process working
on the same drive, the background process is killed ("Open Files
on changed disk"). Gemini uses a dirty trick to simulate a hard disk
change for updating directory info.

3. If you choose to replace the drive icons by folders on drive U:, bug 2
disappears, but you cannot longer MOVE files from one drive to another
(Gemini thinks, that everything is on one - physical - drive).

4. The twins in Gemini are different: Venus doesn't like Minix file systems,
Mupfel does. I have recompiled the Minix fs to tosify filenames on Minix
filesystems for programs running in the tos domain. Now Venus
is satisified too.

Roy,
Thank you for the kind words aout AIM.

As for info about Atari Advantage, Mike Lindsay is taking over Atai Explorer, so that leaves AA's future in doubt. I was told about Mike's move by a member of the "old" Atari Explorer staff. The rumors flying around are that ST Informer has "purchased" Atari Advantage, but I don't know at this time if that is accurate. John Jaischigg and his staff are no longer at Atari after July 31st. Major bummer.

On an almost unrelted topic, has anyone else seen the scathing Forbes article aboutAtari? 8/3 is the issue in question.

Actually, considering the way people on the Net usually react to anything
even slightly critical of Atari, it might be better if they DON'T
read the article in the August 3 issue of Forbes.

Hypertension or even cardiac arrest might be the result...

Message-ID: <1992Jul25.210813.28695@r-node.gts.org>
Source record: 219302

Sorry if this is a duplicate post, but I never saw my original.

I'm trying to get HERMES running. Most of the docs are in german. Is this the standard distribution?

I have run a german to english translator which helps a bit.

Anyway, when I run GUS (ver 1.0), how do I create an original message or news article?

I tried the menu entries 'w' to write a message, it prompts for a header, then mmail runs and creates the control/data files for uucico. Am I supposed to edit the data file from the queue? Seems bizarre to do it that way.

Ok, that's not that big a problem. Once I have the data/control files in the queue how do I get uucico to send them?

I tried running rmail, which is finding the queued stuff ok, then I ran uuwork which is not finding anything for uucico to do apparently.

Is uuwork the program I'm supposed to run?

Is all this stuff supposed to be integrated into GUS?

Who CARES about health!? Post Forbes so everyone can read good and bad news!!
Many companies having bad news now..DEC loses 2 BILLION dollars,
Adlib company goes BANKRUPT, many newspapers now saying Amiga is
DEAD (because of Irving)..

What is happening NOW (today) not yesterday? IF Atari have GUTS
and sells Falcon for under $1000 I AM BUYING A FALCON. (IF C=
sells A4000 less than $1000 I AM BUYING A4000 TOO.

986. Attempt at Objective View of Atari

Newsgroup: comp.sys.atari.st
Date: 1992-07-26 00:41:08 UTC
From: jawalsh@copper.ucs.indiana.edu
Message-ID: <Brz0KL.KD0@usenet.ucs.indiana.edu>
Source record: 219198

Hello All,

I've been reading this newsgroup for the past two months or so. I'm in the market for a computer, and after hearing about the Atari ST, TT, and yet-to-be-released Falcon, I became very interested in the Atari products. Since I'm about to write a dissertation, I need a computer with that will support a *great* wordprocessor. O.K. If my needs ended there, a PC running WordPerfect 5.1 would be great. It so happens that I am also a musician and I heard that Atari's are the best machine for MIDI (Macs are supposed to be pretty darn good with MIDI). I've also heard that Atari's are *great* when it comes to Desk Top Publishing (again Macs compete well in this arena). My other major need is for a michine is very good with network communications via modem or ethernet or other network media.

O.K. So you know what I need. Now, I am fairly knowledgable about computers, and I know there are better things out there for the money than a PC or Mac, so I'm really interested in the Atari products. Of course, I'm afraid that *practically noone owns an Atari/there is relatively little support/there is relavively little application softwarey* but if it's great unit, and I know some people who will help with support(through the net, etc.), and I'm getting more computer for my money, hey, this may be the way to go.

DISCLAIMER: I AM NOT ABOUT TO BASH THE ATARI!

Here is how much I was interested in the Atari. I don't own one, but I was interest enough to spend two or three buck on an Atari Explorer magazine just to see what they looked like. O.K. I'm stil interested after reading May/June issue cover to cover. In this issue they report about the Mid-Indiana ST Atarifest happening today, July 25, in Inianapolis. There it was. I'm from Bloomington, IN, about an hour and a half away. This was the perfect opportunity for an interested person to go look at the machine and actually see how it worked, what it was, etc.

I drove up there this morning (some more in-depth reporting from Atari Explorer would have made my trip much easier) to check it all out.

HERE IS WHAT I THOUGHT:

First, it is important to explain that I wanted to be blown away and impressed by the Atari. I didn't drive all that way to see something I knew sucked. From reading this newsgroup, I really believed that the Atari was great machine (I still believe it may be). I went wanting to come away with the conviction to save my money until the

Falcon was released and then buy one.

Disappointments:

After hearing all the hoopla about Atari and MIDI, there was not one booth at this "Atarifest" running anything MIDI related. To me, this is a serious flaw in organizing. Atari Corp. was there (more on this later) represented by Bob Brodie, and one would think that if no one else was going to do it, Atari would set up a display showcasing one of the recognized strengths of their system.

The on-screen "look" of the Atari was a disappointment. I was expecting a very impressive GUI, and was disappointed by the crispness of the look. A Mac looks much better, IMHO. However, I realize that a lot of these machines (1040 ST's, 520ST's, etc.) are old machines, so all is forgiven there. The TT's I saw were indeed impressive.

The software available at the "Atarifest" was limited and unimpressive. Some of it may be excellent software, I do not mean to insult anyone, but the packaging, etc. looked as though it the software was being written, marketed, and sold by a lot of amatuers and not professionals. There is some charm to owning a computer owned and supported by a network of amatuers, but when one really needs a computer for serious business or productivity, do you want to settle for this? I walked around listening to to software sellers constantly saying, "Well, it doesn't do that yet, but we're working on it." Can we all afford to wait?

Finally, about Atari Corp.: Can you say FAILURE.

O.K. Atari Corp. was represented at this Atarifest by one of their excutives, Mr. Bob Brodie. He was there sharing a table w/ the GEnie people. Atari had nothing to show, offer, sell, explain--nothing. No Falcon--no anything. Isn't this a failure? O.K., so the Falcon isn't ready for release, it doesn't have a price. If it exists, couldn't they at least bring it to a semi-majore Atarifest to show people? The Falcon aside, shouldn't the Atari people have brought something? I am dead serious--there was nothing--no pamphlets about MIDI, laserprinters, Desk Top Publising, nothing--just Bob Brodie sitting there telling people he couldn't tell them anything about the Falcon.

O.K. After finally seeing some Atari machines and the community of support surrounding them I'm much less enthusiastic than before. Please don't write me off as some guy who loves to piss people off and get involved in flame wars. I'm not that type. From all I heard, I wanted to fall in love w/ the Atari, buy one, love it, and laugh at all my PC/Mac-owing friends. Unfortunately, my first experience was little less than a disaster. I just wanted to offer my opinions. I would love to get some helpful responeses explaining reasons why the Atari is still a good choice for a computer. I think a computer that can do great things w/ MIDI and emulate a Mac at a reasonable price would be a great thing for me. My problems are: What the hell is wrong w/ Atari Corp.

(why can't they set up a decent booth?) and Can I get good software for my machine (Wordprocessing, communications, database, etc.--I know there are good DTP programs and plenty o' games).

Thanks to everyone reading this group. I hope this isn't too long. Please don't flame me, but all helpful responses are welcome. I was and still am very intersted in Atari computers. I was all excited to be blown away and was disappointed. Please explain to me why I should still have faith. If I shouldn't, please tell me which PC or Mac to buy.
Thank you, all

987. ST keyboard rubber pads -- where to get?

Newsgroup: comp.sys.atari.st
Date: 1992-07-26 01:38:41 UTC
From: rjung@aludra.usc.edu
Message-ID: <l740h1INNp2r@aludra.usc.edu>
Source record: 219200

Please reply by e-mail.

I'd like to know a source where I can buy those conductive rubber pads that are used in the ST/STe/Mega/TT keyboards. For those of you who've worked with the keyboards before, you know what I mean -- when a key is pressed, the rubber pad closes a contact on the keyboard circuit board, and the keypress is registered.

Anyway, if someone knows of a place (mail-order or whatever) where I can buy a few of those (or even a generic brand name that I can buy from Radio Shack or somesuch), I'd appreciate it. One of my pads has died and needs replacement. I've moved the defective pad to the Help key, but I'd prefer to have a 100% functional keyboard.

Please reply by e-mail.

Hiya!

Any good and loyal Atarian knows it's not hard to find something to scathe Atari about... Atari goes out of its way every day to be a target, then they complain when Ralph shoots at 'em!

Personally, I think the people who own/operate Atari should be taken out to some desert place and machine-gunned. Not that they'd notice. They've been shooting themselves in the foot for years!

Get used to it, if you're planning to get into the Atari environment...
You'll like their hardware, but as a company they suck. They're small
peanuts in a big barrel, and that's all they'll ever be until the
current regime is overthrown. Don't count on that happening soon.

>Can I get good software for
>my machine (Wordprocessing, communications, database, etc.--I know there
>are good DTP programs and plenty o' games).

Find someone who has an Atari already and ask them to show you the
demo version of Caligrapher... Regardless of Atari's desire to be
the smallest computer company on the planet, you'll not regret owning
one for word processing if you end up using this package.

Find someone who has an Atari already and ask them to show you Flash
or Flash II. Telcomm on the Atari is a joy!

Look around for an Atari user group, and you'll find people who will
happily show you the fun things they're doing with their Atari machines.
Just don't tell Atari Corp that you like their machines. That seems
to be a sure way to get them to not produce it.

Hey, I've got an IBM mouse which I think I could hook up to my ST
(its a better mouse than the ST comes with) but I don't have the pinouts
for the mouse. Its an IBM model 001 mouse with a round 6-pin connector.
If anybody could give me the pinouts or a tip on hooking this mouse up
I'd appreciate it. Thanks!

Hiya Mike! :)

Well, you may get your wish soon! Apparently, Jack's back with a vengeanc
,
Everyone seems to parallel this with '77 and

when Jack was at Commodore. The basic gist f the article is that Atari
was once a Forbes 400 company, and now it's stock is bumping along at
$1.50. The article also spells out how Atari doesn't have enough
money to launch the Falcon and Jaguar. So, my feeling is that unless

Jack is willing to dip into his millions to keep Atari afloat, game over.
Jack can still pull it off, but he's got t be willing to spend some of
his own personal fortune to do it.

I have heard from what I consider to be reliable sources (Bob Brodie) that
the final pre-release production run is currently underway. In the AEO
F-net conference, which Bob reads, many people have said that it will be
released in the middle of August, and Bob hasn't denied it; he's usually
quick to quell untrue rumors, especially in the conference he's the lead
sysop of!

>MIDI (Macs are supposed to be pretty darn good with MIDI). I've also
Both true. On the ST, depending on cash, look at Steinberg's Cubase
or Notator from C-Lab at around 300-500 UK Pounds or if cash is at a
premium, PRO 24 III from Steinberg at around 70 UKP. In addition
there are many sound editors, sample editors (Avalon from Steinberg
is good), mixdown automaters, direct to HD sampling systems etc.

>heard that Atari's are *great* when it comes to Desk Top Publishing
>(again Macs compete well in this arena). My other major need is for a
Hmm, Calamus SL is fairly good comapared to most MAC stuff but to be
honest, unless you were wanting only basic abilities, most ST stuff
is a bit underpowered. Pagestream is quite good though at around
150UKP

>michine is very good with network communications via modem or ethernet
>or other network media.
There are Ethernet boards available for Mega STe/TT/Mega machines
but these are quite expensive - Mac ones are probably cheaper.
The serial port only goes to 19200 baud without hardware hacking, for
a lot of people, this is too slow. Most ST comms packages are a bit
average too. It depends what you want to do really. VT100/ANSI
emulation is about as good as it gets.

>course, I'm afraid that *practically noone owns an Atari/there is
>relatively little support/there is relavively little application
This is unfortunately a US problem. In Europe it's a lot better. I
know about 15 people with ST/MegaSTe/Megas, most with harddrives.
This is a bit wierd because ST hardware and software is *much* cheaper
in the States :-(

There is loads of software covering DTP/WP/MIDI/graphics/databases
art etc.

Graphics - Retouche Pro for instance supports 24 bit colour at very high
resolutions via suitable hardware and was recently put against the
best Mac & PC equivelents and came out TOP!!

>After hearing all the hoopla about Atari and MIDI, there was not one
>booth at this "Atarifest" running anything MIDI related. To me, this is

Much better in Europe. At a recent show in the UK, Roland had stacks of STs running various packages.

>The on-screen "look" of the Atari was a disappointment. I was
True. As a result, a very good replacement from a third party supplier (Gribnif) called Neodesk is amust. I've used Macs & Windows 3.1 and this beats them all hands down as a desktop.
Within applications, your stuck with GEM in the main. It's still not too bad once you get used to it. It may not be pretty but it does pretty much everything you'de want.

>The software available at the "Atarifest" was limited and unimpressive.
US specific again I'm afraid.

>but the packaging, etc. looked as though it the software was being
>written, marketed, and sold by a lot of amatuers and not professionals.
I've bought Lattice C5.51, Timeworks DTP 2, Devpac 2 and more. These all come in good quality boxes with great manuals. Easily the equal of PC packages that I've used.

>doesn't do that yet, but we're working on it." Can we all afford to
>wait?
Can Atari???
>
>Finally, about Atari Corp.: Can you say FAILURE.
Atari are basically a joke. It's due only to some incredibly loyal users that they're still going. They haven't really moved forward in hardware terms since 1985. The TT was OK but 2 years late. The Mega STe would have been good in 1987/8 but we've only got it in the UK THIS YEAR!

I suspect the Falcon may be too late to stop Atari from being anything other than a cult machine. On the bright side, unlike a lot of Atari stuff that gets rumoured, this one is real and working and with developers right now.

>Mr. Bob Brodie.
A man with the worst job in the world - he exists to appologise for Atari Corp. If only the erst of them cared about the users as much as he did, the situation would be a lot different.

>Atari had nothing to show, offer, sell, explain--nothing. No
>Falcon--no anything. Isn't this a failure? O.K., so the Falcon isn't
Atari were at a UK show a few months back and had tons of leaflets based around DTP, MIDI, Word Processing and more. They had tons of good stuff on their stand including a TT running SVR4 Unix, Composcript (postscript emulator), laser printers, PC emulators, The ST Book laptop, Calamus SL DTP and much more.

Atari used to get slagged for showing stuff they never released. Now they've gone the other way and wont say a thing about new stuff until it's virtually in the shops.

>O.K. After finally seeing some Atari machines and the community of
>support surrounding them I'm much less enthusiastic than before. Please
Easy to feel that way.

>don't write me off as some guy who loves to piss people off and get
I'm not - I wish more people were as open minded about picking
something other than a PC.

>things w/ MIDI and emulate a Mac at a reasonable price would be a great
The ST can emulate a 386SX PC and a Mac via hardware. Both these
emulations are very good and generally fairly complete
including various graphics modes, extended/expanded memory etc.
I can run Windows 3.0 fine on my ST

>thing for me. My problems are: What the hell is wrong w/ Atari Corp.
They are owned by the Tramiel Family who seem to view the whole
thing as a hobby rather than a business. Their only excuse is a
disasterous dabble in a retail chain (Federated) left them starved
of R&D cash and management resource for about 2 years. The Falcon is
the first thing to come out since this time.

>(why can't they set up a decent booth?) and Can I get good software for
Can't afford it?

>blown away and was disappointed. Please explain to me why I should still
>have faith. If I shouldn't, please tell me which PC or Mac to buy.
To be honest, if you lived in Europe, I'd say get an ST. In the States
I'd be inclined to buy a Mac unless you are willing to invest a lot
of time in becoming part of the ST scene because only they will
support you and your needs, Atari and most dealers wont.
Pay attention to the rest of the world, buy UK magazines like
ST Format, ST User or ST Review. There is a great UK mag
called ST Applications that's mail orderonly. You can buy a lot of
good stuff via mail order from the UK.

>Thank you, all
No problem.

998. SUMMARY: Calamus font trouble

Newsgroup: comp.sys.atari.st
Date: 1992-07-26 17:58:57 UTC
From: kris@tpki.toppoint.de
Message-ID: <1992Jul26.175857.24032@tpki.toppoint.de>
Source record: 219319
Cross-posted to: comp.sys.atari.st,comp.fonts

In <H.roaiWz2vock@jonh.wimsey.bc.ca> jhenders@jonh.wimsey.bc.ca (John Henders) writes:
> I beleive SL refuses to load fonts that have the string " Postscript"
>in the header, so a simple letter change can fix any font converted
>from postscript which puts this in the header. Use one of the many
>available hex editors to change the files.

Some time ago I let out a cry for help, because due to a serial number change I was unable to use my old serialized calamus fonts with my new version of calamus SL.

Many thanks go to the net, some people in Passau and in the Netherlands who shared facts, code and grief with me. Many thanks also go to borland for the turbo debugger, a really powerful tool for everyone who wants to find out about what really is going on within.

Thanks to you all who helped me to understand the calamus font format.

[dmc flame on]

Finding out these details delayed productive work here for about one week and blocked one desk and two persons. Potential calamus customers should add this to the cost for your copy of calamus if you consider buying this program.

The brain dead font serialization scheme of calamus does stop you effectively from distributing your work or building pipelines of workers. For examples we here often get half baked documents from several other people that have a sample page of layout ("I should look like this!") and have to be finished by us.

Since these people use fonts we don't need for our own work, we do not have these fonts with our serial number (we don't need them in our documents). To finish the work and use their fonts with their documents we had to install versions of their copy of calamus on our harddisk. Maximum was four different copies of calamus eating up valueable disk space. Sometimes we had differing versions with different features and bugs and us switching between them rapidly. This is not a friendly working environment.

When we upgraded our machine to an Atari TT, their old
versions of non-SL calamus were not longer functioning
properly on our new machine. Our copy of calamus SL
worked (No, it did not "work fine". Most of the
advanced features were "not yet implemented", rendering
the program unusable for serveral months for us), but
the serial number changed. There we were: Unable to use
our purchased, serialized fonts, unable to finish the
work other people unloaded onto our desk, with
deadlines to keep and the clock ticking.

Resumee:

Calamus is useful tool for page design and layout.
Because of my personal experiences with its font
serialization scheme and because of the experiences
other sources, who tried to install and use public
domain or third party fonts, shared with me, I strongly
dicourage anyone from buying this program. I recommend
that under all circumstances you try to get another
tool to get your work done. This recommendation is
solely based on experiences with this font
serialization mechanism - if it breaks (and it did
break for us), it stops you from getting any work done
at all.

[dmc flame off]

Please note:

In message <A9208@MZ.maus.de>, Pierre_Hansen@mz.maus.de (Pierre
Hansen) wrote:
> I don't think this kind of diskussion is funny at all.
> Deserialising fonts is illegal and DMC will not watch this
> without taking action.

So if you have any problems with your calamus fonts, please
don't help yourself. Instead report your problems to your
dealer or to DMC and stop working at all. Stand by and wait for
these people to get your problem solved. This may take some
time, but don't worry. Don't worry about your deadlines, it is
not your fault if you cannot deliver in time.

Please under no condition do this:

- never set the serial number of your font to zero, i.e. don't
setlong(font, 0x0010, 0L);

- under no circumstances set the font initial coding mask to
zero, i.e. don't setlong(font, 0x10b6, 0L). If you do this by
accident, forget the old mask value and don't reuse it in the
algorithm below:

- never run the following program fragment or something similar
on the offset block of the font. The offset block is an array
of relative pointers to the beginning of the fonts outline.

```
i = 0x1bc;

for (j=i;j<=i+size; j += 4)
{
position = (j-i)/4;

l = getlong(font, j);
l = l ^ (serial_number + mask * position);
/* printf("%lx:%lx\t", (j-i)/4, l); */
setlong(font, j, l);
}
```

- Never sort the outline definitions of the font.

The outlines of the first few character outlines are swapped
or not swapped, so that the offset values into these outlines
are not monotone increasing. Additional serial number
information may or may not be hidden within the order of the
outlines for the first few characters of a font. This
information might or might not be checked by newer calamus
versions.

If you sort the outlines, any potential serial number
information which is perhaps contained in these permutations
would be lost.

- Never overwrite the copyright notice of your font, since it
might or might not contain some keywords such as
"compugraphic" or "postscript" which could be checked for by
calamus. Calamus could not correctly reject your font, if it
does not find these keywords. So please don't touch them.

- Never decrease the baseline value (offset 0x1e0) by one if
its inital value is 0x2710. Should the above transformations
be applied to any of your serialized fonts by some accident,
rumor says that calamus could use the value 0x2710 at 0x1e0
to correctly reject the font. So, please leave this value
alone!

- If any of your public domain or third party vendor fonts is
not functioning properly, please don't check if any of the
above rules matches the problematic font. Instead don't use
public domain or third party fonts with calamus, the are not
good for you.

Instead, sit down, stay calm and wait. Don't panic.

Thank you,
Kristian

1000. MAC 128K ROMS FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1992-07-26 18:38:16 UTC
From: bantolph@carina.unm.edu
Message-ID: <f3kmckq@lynx.unm.edu>
Source record: 219315

I have two Mac 128K ROM's for sale. I had intended to use them
for Spectre GCR but have decided to do something else. If anyone is
interested the chip numbers are:

8841bv o r2424 8842av o r1702
23512-1055 23512-1054
342-0342-b 342-0341-c

Both are VLSI chips and are copywrited by Apple from '83 to '86.
Both chips came from a 1989 era Mac plus and are compatible with all
the new Apple software. They are also the correct chips for Spectre
GCR.

I am asking about $225 for the pair.

email to bantolph@carina.unm.edu

Damien's not on the Internet--he's in Germany. However, if there's something
you need to get to him, well, there's a guy on GEnie (where I am, also), who
corresponds with him a good bit, and I can get mail to him, who can then
get it to Damien.

Did that make any sense? You get the idea, though.

Mike.

Oddly.. this does seem to be true... since the "new mac superdrives" appear to be "normal hi density drives" Hence, if you have a hi-density (1.44 meg) drive in your Mac Emulation box... Fancy GCR goodies are not required unless perhaps you need to read 800k mac floppies. Don't know how to get around that one!

So while GCR limits you to 800k disks... the PC goodies for reading mac disks limit you to 1.6 (2Meg?) disks.

Source record: 219308

I'm sorry... A3000 and Falcon are not comparable machines. Targeted for
different markets. The 3000 is clearly a superior machine. The Falcon
is a midrange machine targeted for a specific market... it looks like
the perfect sound synthesis MIDI machine. Especially if the Falcon is
packaged in a 1040 type enclosure, the machine certainly is not targeted
at a general market, and is not expandable for specialized hardware (not
that it needs much expanding... Jesus, TWO hard disk controllers built in!).

Source record: 219309

Umm... we should see working models of the Falcon on sale in the next two or three weeks. I know of few dealers who would be telling their customers, Oh yeah, I'm gonna be carrying that if the machine was really vapor. Besides, the most recent stats I've seen are too consistent and realistic to not be believed.

Thom

1006. Re: ATARI STE vs. ATARI MEGA STE

>installed would zip right along, so you have a machine that is a TT
>except for the nameplate... :-)

The original poster specifically mentioned the SST and that's why I commented on it.

The TinyTurbo and Turbo030 accelerator boards are totally different in theory to the SST. The SST lets you add the accelerator, RAM, and other accoutrements as you see fit. The accelerators from Fast Tech are designed differently for different tastes and a different market.

From what I understand, the TinyTurbo does NOT have the extra 32-bit(?) RAM that the SST and Turbo030 have. The TinyTurbo seems to be a T-16 or T-25 on steriods, sporting a 68030 with cache. (Of course, if I'm incorrect in these claims, I'd surely hope someone would correct me.)

In the second line, you say the TinyTurbo030 has loads of options. Care to inform us what only a couple of these "options" are?

The MegaSTE with a TinyTurbo030 would zip along quite nicely, but it's nowhere near a TT. The TT has much more to it than a 68030, and that's why I'm buying one and selling my MegaSTE. There's RAM expansion capability in a TT which the MegaSTE doesn't have, extra resolutions for animations which will hold me over until Leonardo comes out, and a SCSI port.

The latest AEO briefly discusses Mike Lindsay's new control of AE. The impression I got was that Atari Advantage would be no more and that left over subscriptions might be converted to AE.

I don't understand why ST Informer would 'purchase' AA. Rod seems to have plenty to do with ST Informer. :^) But then, you may know more about this that I.

>On an almost unrelted topic, has anyone else seen the scathing Forbes
>article aboutAtari? 8/3 is the issue in question.

Yes, I've read it. There's been some discussion of it on GEnie. Most people are saying that it's what ST users have been saying all along, but they're glad that someone from the 'outside' has commented capably on the subject, including knowledge of the Falcon and Jaguar.

s> Hmm, what do you mean by "unavoidable pachtes"? Don't forget, that only
s> resident programs are allowed to change system vectors. If the are
s> programmed cleanly there are no major problems.

This is miles off whack - I know what the original poster is talking about, but it needs to go one further. The jumptable needs to be _private_ to the operating system, and there needs to be a function to register and deregister handlers for individual operating system functions. (either terminal or passthrough handlers in fact).

Why? well, I ran into this problem while documenting the development requirements involved in implementing NFS/RPC/TCP/IP for the ST and some IP-aware ACSI/SCSI <-> Ethernet hardware a friend and I are developing. We want to be able to replace, at the terminal level, a substantial number of OS calls, particularly those related to file operations.

UNFORTUNATELY, and I really would like to be left in the same room as the cretin at atari who came up with this idea, the OS calls itself _DIRECTLY_, and so all of the other functions that do disk access have to be replaced as well. Now, it's one thing for a software company to have a programmer or two knuckle down for a fortnight and rewrite the whole thing, but I don't have that sort of time, and I want to write something that will be as universally portable as possible. Replacing Pexec() (argh!) and worse still, Rsrc_load() promise to be bundles of fun, I don't think. If they just bothered to call Fsfirst/Fopen/Fread it would be wonderful, and make life much easier.

This doesn't mean that the OS has to be re-entrant - even if there was an internal dispatcher vector to hook for internal OS cross-calls that would _barely_ do it.

As it is now, the whole project has been pushed to the backmost burner, as I've lost a lot of momentum trying to work around this.

>> 6) Software support for 2.88MB floppies (Last I heard, there isn't a
>> greyed out option for 2.88), and the possibility of swapping a: from the
>> floppy bay to a specified SCSI ID (such as for one of the new 20MB
>> flopticals).

s> I think there is no reason why you shouldn't be able to write
s> a floppy
s> driver that supports flopticals. In my opinion that is not ataris work.
s> BTW, the new AjAX floppy controller supports a clock rate of up to 32
MHz,
s> so there may be some hardware kits for 2.88 MB floppies in the future.

There's no need (as I understand it) for anything but the desktop format routine to be changed slightly anyway... I've never had any trouble with bizarre disk formats, or the ST's ability to handle them)

c> Sounds like a program I'd like to pay the fees for if it does what
c> it promises. Are the authors out there?

Umm. It 'works' on my TT (ST high only, and the 'wrong rez' alert is broken anyway - the alert button is continually toggling between highlighted and non-highlighted, and the mouse disappears. Reboot time.)

Unfortunately, while it seems to work, the user interfarce (yes...) can only be described as highly bogus. Why the authors didn't just go for a plain gem-based approach I will never know, unless they flame me.

If I were to spend my money on this thing, (and yes I might, if it works, seeing as I do quite a lot of circuit design) it will need to be cleaned up immensely. Hopefully craig and co won't lose hope on this - it's a _VERY_ worthwhile project that just needs a bit more work.

Well, to be frank, your opinion isn't worth too much. If I mention 'economy of scale' do your eyes glaze over? Try networking any other small-market system and see if you come off that well.

I assume you're using something like PCditto here - unfortunately Gemdos and
MessDos use differing partitioning schemes, so unless your emulation
software supports translation between the two (ie BGM <-> 0x06) then you're
stuck.

A while back I asked about the quality of Joppa's
Fax-software. One or two people replied, saying they like it.
What I really wanted to know was whether that package, or any
other for that matter, allows you to send and/or recieve faxes
without...WITHOUT...a fax modem?
Anybody know?
Thanks,
Gerry

I tried posting this in comp.sys.mac.systems but all I got was some idiot telling me to buy 4meg of ram and get system 7.0 to use on a Mac-Plus. (Spectre)

I was wanting to know the basics of the additions/removals of system versions 6.0.5, 6.0.7 and 7.???. This is for a friend who owns an Old Mac-Plus, with 2meg, and a Hard-Drive. And he is wondering which is best for a Mac-Plus which doesn't use too much RAM, and doesn't slow the system down too much (as apparently system 7 does on a Mac-Plus)

Any helpful information would be great!

You are entitled to believe anything you want from these people. But
c'mon! Really! Do you honestly think you'll be able to buy a Falcon
in '91??? You'll be able to see them at shows. You'll hear about them
being sold in Europe. You'll even be able to order one. But you aren't
gonna have it in your hands this year.

We're talking Atari here! Believe me, I'm one of the most hardcore
pro Atarians you've ever met. But I don't trust the company as far
as I can spit. They're a bunch of rank amateurs who couldn't turn
Atari around if their lives depended on it.

Falcons readily available to the buying public THIS YEAR???? POPPYCOCK.

>>That's rich! Have you considered standup comedy?

Please step back and look at the CURRENT situation. IBM is announcing
due dates and missing them by years. Microsoft is not doing much better.

Atari did NOT publicize TOS 2.06 until it was ready. They have resisted
issuing a due date for the Falcon, or even releasing specs, until they
have firm facts. They have followed this policy for the last few years.

I respect them for making a stand.

Well, I actually think things are different this time. Two-three weeks from now is way too optimistic. But think about it. The hand-writing was on the wall when the annual report came out showing that Atari annual revenues were down from $4?? M to $2?? M in 1991. Everyone knows the trend is bad. Then, on top of it, everyone in the ST community knows this new machine is coming out, which makes things even worse. Now almost nobody is buying an ST; I can imagine that revenues have really dried up since word of the Falcon has gotten around. I hope they can just stay solvent until revenues start rolling in from it. But this all is _very_ strong incentive to get the thing out the door soon; if they don't they might just plain run out of cash and go belly up.

All of this is in contrast to prior years when the TT and MegaSTE were being announced. They were fat and happy. Well, at least profitable. Deadlines slipped and no-one really cared that much.

One other thought. Doesn't it make you kind of sick to think what could have happened if the Tramiels had, instead of spending that $160 million on Federated, spent it on developing the ST? Just think how many systems software and hardware engineers they could have hired with that. They could have kept the ST years ahead of the other platforms, advertised it heavily, underwritten the porting of major apps to it, etc. The ST could be a major player now. Sigh...

The above alias assumes that init was the first thing started by MiNT. To do the equivalent in bash it is "alias shutdown="kill -15 1"" or you can just use kill -15 1 on the command line.

> I cant seem to use kill at all from bash? Also the
>mintbash.zoo the latest version of bash?

I don't know, I've ditched Bash in favour of a combination of ash and tcsh (That reminds me, I've got to post those diffs to ash which allows it to work properly). Anyway, I always used my own oport of Bash anyhow :-).

Hi!
I've just uploaded WinX 2.0 to the Umich Archives.

It's in the /atari/new directory as winx20.lzh.

European users will find it on ftp.uni-kl.de in the /atari/misc directory.

The program works just fine on TOS 1.2 and 1.4, but need a prog called GEMRAM to function on TOS versions above these - does anyone know where to get it?

I'm also looking for the IconManager app. It this app free/shareware? Need it for GemView.

>
> Jens.
>--

My setup seems pretty normal, since I had managed to use it for quite a time before GEM.PRG started acting weird. Anyway, I normally start on tcsh (but I have the same problem with the MiNT vanilla shell). In fact I'm quite happy with not using GEM at all (although if I ever see a MiNT aware Gemini, I'm gonna use it like hell :-), but once in a while I do need to start it in the middle of a session. So, I'm not starting GEM twice as it was sugested in another posting. I cleaned up both the /auto and *.acc files, but it's still no good.

Well, thanks to those who answered my posting. For the time being my ST is at the doctor's: last week I had frequent bus errors out of the blue, and the blitter died on me :-(. When I get it back I think I'll re-install everything, including MiNT - perhaps that'll take care of my problems... (l'espoir fait vivre!).

By the way, someone suggested here the creation of a MiNT FAQ. I most emphanticaly support this :-). Items could be: installation, links & the universal drive, MGR, GNUstuff, etc.

1026. ANSWER -> Using Joysticks

Newsgroup: comp.sys.atari.st
Date: 1992-07-27 11:58:54 UTC
From: tony@microware.co.uk
Message-ID: <1143@mwuk.UUCP>
Source record: 219344
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi Folks,

Recently I have seen a number of postings asking for details about using the joysticks on the ST. This posting attempts to provide some help.

I never saw it properly documented, so about 4 years ago, using information from the old Abacus/DataBecker internals book, I set about investigating the Keyboard vector routines, using a packet handler which I could patch into the vectors I wanted to investigate. The C program I used is given below. As written, it hooks into the status and joystick vectors. For just the joystick information, it is not necessary to use the status vector. Obviously, the program could be cut down to just bare bones for joystick handling, but I thought the complete thing might be of interest.

It was compiled using Lattice C 3.0.4. UBYTE is just a typedef of unsigned char. You won't need <portab.h> if you define this by hand. cprintf() is just printf() directly to the console. The include file <fctype.h> is just a variant of <ctype.h>, which itself would do fine.

It should be compiled to a .TOS executable.

```
------------------------------------------------------------------------
#include <portab.h>
#include <osbind.h>
#include <fctype.h>

typedef struct {
void (*midivec)();
void (*vkbderr)();
void (*vmiderr)();
void (*statvec)();
void (*mousevec)();
void (*clockvec)();
void (*joyvec)();
void (*midisys)();
void (*ikbdsys)();
} KBVEC;

UBYTE joy0,joy1;
UBYTE list[10];
int got=FALSE;

void dopkt(packet)
UBYTE packet[];
{
```

```
register int i;

for(i=0;i<10;i++)
list[i]=packet[i];
got=TRUE;

if (packet[0]>=0xFE) {
joy0=packet[1];
joy1=packet[2];
}
}

void main()
{
KBVEC *p,save;
UBYTE old0,old1;
char buf[128];
int cmd;
char c;

p = (KBVEC *)Kbdvbase();
save.joyvec = p->joyvec;
p->joyvec = dopkt;
save.statvec = p->statvec;
p->statvec = dopkt;

Ikbdws(0,"\x12"); /* Turn mouse off */

old0=old1=0xFF;
cmd = 0;

for(;;) {

if (Cconis()) {
c=toupper((short)Crawcin());
if (c=='\x03') {
Ikbdws(0,"\x08"); /* Restore mouse operation */
p->joyvec = save.joyvec;
p->statvec = save.statvec;
Pterm0();
}
else if (c=='\r') {
buf[0]=cmd;
Ikbdws(0,buf);
cmd = 0;
}
else if (c>='0' && c<='9') {
cmd = ((cmd & 0xF) << 4) | (c-'0');
cprintf("cmd = %X\r\n",cmd);
}
else if (c>='A' && c<='F') {
cmd = ((cmd & 0xF) << 4) | (c-'A'+10);
cprintf("cmd = %X\r\n",cmd);
```

```
}
}

if (got) {
cprintf("Packet = %02X %02X %02X %02X %02X %02X %02X %02X %02X %02X\r\n",
list[0],list[1],list[2],list[3],list[4],
list[5],list[6],list[7],list[8],list[9]);
got=FALSE;
}

if (old0 != joy0) {
old0 = joy0;
cprintf("Joy0 = %02X\r\n",old0);
}

if (old1 != joy1) {
old1 = joy1;
cprintf("Joy1 = %02X\r\n",old1);
}
}
}
```

Armed with the information gleaned by this program, it was possible to write assembler routines to setup, use and unsetup the joystick. JOYINI and JOYEND should be callable from ASM or C, and the global variables JOY0 and JOY1 will be updated automatically whenever a joystick state changes.

I can't remember what bit means what, but that is easily determined by trial and error.

```
;
JOYINI MOVEM.L A0-A1/D0,-(SP) ; Save registers
MOVE.W #34,-(SP) ; Kbdvbase()
TRAP #14 ; Xbios
LEA 2(SP),SP ; Better than ADDQ, as it
; doesn't set any flags.
; Now D0 points to the table of longword vectors. The
; joystick vector is at offset 24 from this.
;
MOVEA.L D0,A0 ; Must be in an addr reg
MOVE.L A0,ADRSAV ; Save table address
MOVE.L 24(A0),JOYSAV ; Save current joy value
LEA OURJOY(PC),A1 ; Position independent
MOVE.L A1,24(A0) ; Point vector to our code
PEA MOUSOF(PC) ; Command to turn off mouse
MOVE.W #MOUSOFL-1,-(SP) ; Length-1
MOVE.W #25,-(SP) ; Ikbdws()
TRAP #14 ; Xbios
LEA 8(SP),SP ; Tidy stack
```

```

1027. Difference between SCSI and SCSI 2?

Newsgroup: comp.sys.atari.st
Date: 1992-07-27 12:27:17 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Jul27.122717.20063@crc.ac.uk>
Source record: 219338

Can anyone tell me what the difference between SCSI (1) and SCSI 2 is?
Or for that matter the difference between SCSI and for example IDE?
(apart from the fact that they use different connectors)
Thanks
Phil
(E-mail naffara@uk.ac.crc)

Well, thanks for the replies about a decent hard drive backup program. Loyalty seems to be divided pretty equally between Vault and Turtle, so I've pulled them both and tried them out. The thing is, they both only accept standard format disks- since I've got a high density drive it would be nice to be able to back up onto 1.6 Mb disks and halve the number of disk swaps. I heard that Diamond Back did this, but it isn't PD. Anyone know of a PD program which can use high density drives? TIA...

1030. Disappearing Floppies

Newsgroup: comp.sys.atari.st
Date: 1992-07-27 12:50:40 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1992Jul27.125040.5401@aston.ac.uk>
Source record: 219339

Hello again. When I boot up my system for the first time, the floppy drives aren't recognised. I bought the system from a friend, and he says it's because the machine boots from hard drive and doesn't get around to checking for floppies - if I reset they appear fine, or if I change the number of installed drives using Control Panel++ then there's no problem. So this isn't a catastrophe, just a minor inconvenience. The thing is, when I bought this ST it had a program in the AUTO folder called 'TWODRIVE.PRG' which told the ST there were two drives attached, but I accidentally lost it. The program was actually written by my friend, and he's lost the source, so I can't get another copy, but if this is a common problem then there must be something similar around in PD. Can anyone help?

> and the AHDI 5.00 package I recently grabbed from comp.binaries mention
> a program called SHIP.PRG whose purpose is to park the heads of all
> attached SCSI drives. Neither actually has it. Is this program
> available elsewhere, or is the documentation just zeebed? [PS. I know I
> can do this from HDX, but SHIP sounds easier to use for this particular
> purpose.]

What you probably need is the slightly updated version of the program called shipacc.prg. This can be run either as a normal program or as a desk accessory - just change the extension to .PRG or .ACC as required. (I have mine tied to a Neodesk keyboard macro so at the end of a session I just press CTRL/Left-shift/P to park my disk, and I have a note on my NeoDesktop to remind me of the keystroke combination, but that's by the way.)

I'd be surprised if you couldn't find it at atari.archive, but until we get a proper connection to the UK academic TCP/IP service it's just a bit too complicated for me to check this out quickly for you. Maybe someone else could oblige?

Graham

1033. CLA_V1.PRG RUNS ON TOS 1.0 ....

Newsgroup: comp.sys.atari.st
Date: 1992-07-27 14:13:23 UTC
From: mmartin@neumann.une.edu.au
Message-ID: <mmartin.712246403@neumann.une.edu.au>
Source record: 219340

There have been several posts concerning problems running the extracted cla_v1.prg, a digital circuit simulator. I was also having problems until I used version 2.01h of lharc downloaded from atari.archive.umich.edu. The -x switch must be set on lharc.ttp to extract to the required directories.

I am using a 1 meg 1040ST with TOS 1.0. The manual says that the program will run on a 520 but I get 3 bombs or an error message unless there is 700k or more free RAM.

I haven't had a chance to really try the program yet but at first glance it looks quite interesting for those people with a perverse interest in logic circuits and suchlike.

Mark.

>quantities?

That's why (as another post said) the Falcons are currently in production. If they are being produced now and are released in August/September, then there will be 2-3 months production ready to go into the pipeline when they are released.

Of course if everyone flocks out and buys one there still won't be enough, but even if they are super-super slick not everyone is going to have the $$$ to slap right down and buy one.

Anyway, I know Atari has fumbled the ball in the past, but they have given some sign they are rising again. Let's all just sit back, wait till September and see what happens.

1038. HELP: CrackArt

Newsgroup: comp.sys.atari.st
Date: 1992-07-27 19:03:23 UTC
From: ortega@cactus.org
Message-ID: <1992Jul27.190323.26339@cactus.org>
Source record: 219349

I've got the program, I've got the translation of the docs
(thanks to someone in New Zealand, I think), and I managed to
squeeze it into my puny 1-meg 1040.

Does anyone know how to use the CRACK FILE (F5) and
CRACK DISK (F6) functions?

The documentation doesn't say much other than the
functions are used to search through files and disks
looking for graphic data and palettes.

I've loaded a .PRG file hoping to be able to find
the graphics info in there, but have had no luck.

>the middle of a session. So, I'm not starting GEM twice as it was sugested in
>another posting. I cleaned up both the /auto and *.acc files, but it's still
>no good.

if all u want to do is start the occasional GEM program under tcsh, i posted a program to atari.archive to do this. as i recall it is a file called rg10.zoo (rg = "run gem"). it is basically like the "gem" command in gulam and other shells. note that gem must already be running (actually started, not "running"). it is in ~ftp/atari/new (you can't do an "ls" but u can get the file with "get rg10.zoo") on a.a. i am told tcsh must be a prg not a ttp because the desktop loader starts the 2 differently. on entry, rg will: 1) hide cursor, 2) show mouse, Pexec the program. on exit, the process is reversed. rg is a (minimal) gem application itself. get the file in binary mode via FTP. tested daily (by me) with uniterm. i work at home most of the time.

the way i boot up is to start mint as the last thing in my auto dir and go to the desktop. it opens right to the path of tcsh.prg, so i then just dclick on it and never see the desktop again. if i need to run uniterm, i have an alias: alias trm 'pushd $unipath;rg uniterm.prg;popd'. rg is in your path, of course. i don't keep uniterm in my path (and i think rg currently needs a path since it does not search for the file) hence the pushd/popd. uniterm has a resource, too. then i just do "trm" and uniterm starts up. i do this for the half dozen GEM programs i run. i posted source with it so u can beef it up (add code to make gray "desktop" background, find file in path, etc).

of course typing 3 chars+ret is not anywhere near as convenient as mousing into 20 different directories under the desktop to get to uniterm and it takes me almost 1 second to type this so it may not be as fast as a mouse. unfortunately, i can issue "trm" from any directory i happen to be in as well. another weakness of the CLI approach is that i can alias to "t" instead of "trm" if i wanted to, thus saving 2 keystrokes (but still having to type 2 keys). and i have to remember a single char rather than the path where i keep uniterm. with only 62 upper/lower case letters plus numbers from which to choose, i quickly run out of 1 char aliases and i then have to be saddled with the huge inconvenience of actually typing one of the possible 3844 two char combinations. it is so bad a situation that i use exactly the same aliases "on the job" so my productivity is far too high and i have way too few environments to try and remember. too bad i use POSIX/ANSI compilers/tcsh

at work and at home, too. tsk, tsk. woe is me and others like me... :-)

> without...WITHOUT...a fax modem?

It is not possible convert an ordinary modem to a faxmodem by running some software in your computer.

Some people get this idea, because there are programms floating around that do _HAM_fax_ which requires expensive amateur radio equipment and licences (depending on your country).

One atari rep' (I think it WAS Bob Brodie) said that the Falcon would not be fully ready for release, until most probably some time in the 1st quarter of 1993. SOunds like an interesting machine, cross between the STE & TT. Supports most of the TT's screen modes, and can show a rather large amount of colours on the screen at once. Has the blitter, an 030 chip (running at 33Mhz) and all the other STE's stuff.

If anyone has access to FNET, send a private E-Mail to Bob Brodie himself! (although, an informative reply is unlikely)

1050. Hardware upgrades of a 1040STF

Newsgroup: comp.sys.atari.st
Date: 1992-07-28 00:58:30 UTC
From: morrison@ee.ualberta.ca
Message-ID: <morrison.712285110@ee.ualberta.ca>
Source record: 219205

Greetings,

I have (beneath my hands) an old (c. 1985) 1040STF. I am curious about the potential for upgrade of this machine. Specifically, memory, TOS (currenly 1.0), and special things (like blitter, and accelerators). I have been told that there is a 2.5 M upgrade and a 4 M upgrade, without much detail. Will they fit into this tiny case? How about TOS? I know 2.06 is around, but how easy will it be to get into this thing?

I am curious about the accelerators as well. The SST board--will or will not fit? How about the TinyTurbo '030? What are my memory requirements for either of those? Would I be better off getting a Mega2 STE? I understand the megas have a VME bus--true? Will the accelerators word on the STE's? I burn to know the answers to these questions and more!

>blitter, an 030 chip (running at 33Mhz) and all the other STE's stuff.

He was saying that a few months ago. In his latest posts, he's been saying "middle of August". You forgot... the DSP chip, one of the most important features! :) Rumors have said either 16 MHz or 33 MHz, don't know which yet. Maybe 2 versions?

>If anyone has access to FNET, send a private E-Mail to Bob Brodie
>himself! (although, an informative reply is unlikely)

I've followed the Fnet closely. He's always giving his usual replies; "can't say that!" "not for public consumption" etc. , but he throws in a few tidbits once in a while. You can reach him through internet at Compuserve: 70007,3240@Compuserve.com.

Source record: 219212

In a previous article, yegerleh@cortez.ecn.purdue.edu (James D Yegerlehner) says:

>Well, I actually think things are different this time. Two-three weeks
>from now is way too optimistic. But think about it. The hand-writing
>was on the wall when the annual report came out showing that Atari
>annual revenues were down from $4?? M to $2?? M in 1991. Everyone
>knows the trend is bad. Then, on top of it, everyone in the ST
>community knows this new machine is coming out, which makes things
>even worse. Now almost nobody is buying an ST; I can imagine
>that revenues have really dried up since word of the Falcon has
>gotten around. I hope they can just stay solvent until revenues
>start rolling in from it. But this all is _very_ strong incentive
>to get the thing out the door soon; if they don't they might
>just plain run out of cash and go belly up.

I can't agree with you more. Everything that you have said makes sense.

Though, the logical step for Atari would be to sell the Falcon 030
in its strongest market first, Germany.

Let's face it, Atari does not have a lot of money to spend at the
moment. Atari should not even attempt to push the Falcon 030 in the
United States until it has about $20 million for advertising.

I bet it starts being sold in Germany at the end of September, a major
advertising campaign from October to December in that country.

The UK and all the other European countries MAYBE December.

The United States... February or March.
But I believe Atari will push the Lynx with a major advertising campaign
for this Christmas. The Lynx seems to be a good product for them
to make money off of (or at least the games for it).

>
>All of this is in contrast to prior years when the TT and MegaSTE
>were being announced. They were fat and happy. Well, at least
>profitable. Deadlines slipped and no-one really cared that much.

You are right. But one thing that is really sad is that the first
"what looks like a winner" product that Atari is planning to release
will probably not get the welcome it deserves of advertisements.

>
>One other thought. Doesn't it make you kind of sick to think
>what could have happened if the Tramiels had, instead of
>spending that $160 million on Federated, spent it on developing

>the ST? Just think how many systems software and hardware
>engineers they could have hired with that. They could have kept
>the ST years ahead of the other platforms, advertised it heavily,
>underwritten the porting of major apps to it, etc. The ST could
>be a major player now. Sigh...

Yes, it does make me sick. Why buy K-Mart size stores to sell your
personal computers in? I can't believe it...

I could list a lot of other goof-ups as well.

>
>Jim
>
>

P.S. When the Falcon 030 is released, I think we are all going to have
to get together and give software companies a wake-up call. The present
amount of new ST software released in the U.S. is close to nothing
and European software are becomming very few.

I am planning on buying a used Z Ram 2.5/4 meg upgrade board for my ST. I have seen the board advertised new for around $85. What would be a good price to offer on a used board?

Since the board I am buying is unpopulated, I will need to buy (I think) 16 1 meg chips for a 2.5 meg upgrade. What is a good price for these chips, and where can I buy them?

Any info would be appreciated.

Atari developer told news of MultiTOS progress (over 70% software now running is good?)

To : Edward Kovarski
From : John Cole at H.A.U.G. BBS (Node #74)
Subj : Re: <16563> MultiTOS

Previously Edward Kovarski wrote:
> Mr. Rider. Are we still having trouble digesting the fact that MTOS is n
> what you claim it to be and that I received a copy of FoReM PC for *free
>
> BTW, try it on a good 'ol ST/E and then give me a rave review about it.

As one of the people on the Multitos distribution list, I do have the latest version of MultiTOS and it has NOT reached version 1.0! It does work well on a STe, and a suprising number of programs work with it. In fact, well over 70% of the programs I have run! Updates for MTOS are happening at a fantastic rate and it is improving to a finished prouduct surprisingly fast. Remember that most other OS versions probobly has similar problems that your 'beta' version has.

This prouduct is currently under development by Atari and while it seems that Atari has chosen to be slightly more vocal about this project than most others, developers should not be talking in-depth about this project, nor handing it out to people who have not been cleared by Bill Rehbock at Atari.

Your critisism of MTOS is highly premature. There are inherent problems with soft-loaded OS, as MTOS is currently. People who use softloaded versions of TOS run those at thier own risk! Almost no developer recomends using softloaded TOS 1.0 to solve compatiblty problems, since this places a hard disk at a grave risk.

If you were given MTOS in confidence, please keep that confidence and dont disclose info about MTOS prematurely. I've already streached myself more than I feel comfortable, so I'll be quiet now ;-)

1058. NEW Atari Falcon news

Newsgroup: comp.sys.atari.st
Date: 1992-07-28 05:37:40 UTC
From: jyoung@nyx.cs.du.edu
Message-ID: <1992Jul28.053740.6506@mnemosyne.cs.du.edu>
Source record: 219217

Here is lots of new about Falcon!..

IN SEARCH OF THE ATARI FALCON 030

Even though no official word is available, even though Atari has maintained a lid on details, and even though some leaks claim that the new computer to be unveiled this fall won't bear the name FALCON, the rumor mill has provided ample pseudo-information on what is expected to be a remarkable machine.

Atari held an invitation-only Falcon developer conference in London on June 27th, attended by over 120 developers. Sam Tramiel, Bill Rehbock, and John Skruch were among those attending the conference for Atari. In addition to the Atari personal, a few experts were brought along to discuss features of the Falcon and programming the Digital Signal Processor. Reactions from the intense one day affair varied from the positive to the wildly enthusiastic. A number of the developers that attended are not currently working on Atari platforms, but the demonstrations and discussions appear to have convinced all of them to either reconsider their position or to immediately add Atari to their development programs.

Sam Tramiel has planned to reveal the Falcon technical details in live conferences on the GEnie and Delphi telecommunications networks in early August. This will be in preparation for the huge Dusseldorf Atari Messe ("fair") in Germany, August 21-23, where the public should see the Falcon for the first time. Commercial availability for the units is projected for later this fall.

A first look almost came early, through the efforts of Atari Advantage Magazine. An exclusive Falcon story, complete with photographs of the outside and even the motherboard of the Falcon, was planned for their June issue. However, delays in production caused that issue to become the June/July issue, and then negotiations with Atari Corp regarding non-disclosure matters caused the photographs to be dropped and the printing to be further delayed until late July. The photographs will instead be featured in an upcoming issue of Atari Explorer (see related story, below). The Atari Advantage Falcon article remains generally complete, and is recommended reading, even getting "thumbs up" from Atari officials. The Falcon issue should be available at Atari dealers well into August.

Speculative Specs

The Falcon 030 (it may still be called something else when released, but this name is now seeming to stick) will feature a 68030 running at

16mHz, be in the 1040-style one piece cabinet, and feature "more colors than you can see, more sounds than you can hear", and use a Motorola Digital Signal Processor DSP 56001 (like in NeXT). It will have an updated TOS operating system that will include MultiTOS multitasking. That much is official. The rest is via leak and speculation, and as such, subject to change.

MultiTOS was developed by ATARI Corp. in cooperation with Eric Smith of the Mathematics Department at the University of Western Ontario. Eric designed the multitasking kernel called MiNT, which forms the basis for MultiTOS, a combination of ROM code in the TOS and extensions on disk. Message pipelines exist between parallel running applications, allowing controlled interaction of simultaneous processes in different windows. Old-standard desk accessories now unnecessary due to CPX modules and the ability to run programs simultaneously, in effect, making every application work like an accessory. Under MultiTOS, if one of many parallel running applications should crash, the others remain protected and safe. A more limited version of MultiTOS for older ST computers is expected to be available as software.

According to the Atari Advantage Falcon story, the Falcon case will be a dark grey, similar to the color of the Portfolio and STacy. It will feature an STe/TT compatible LAN port plus and industry standard SCSI II peripheral port, stereo microphone and headphone jacks, STe extended joystick ports, a DSP port, and a built-in speaker. This last item is important as the Falcon will be able to use standard high resolution color multisync monitors which typically have no audio. Older Atari monitors will also be usable with an adaptor. Broadcast quality TV compatible video is offered with built-in genlock and "true color" 32,768 color capacity plus a variety of other modes (including all ST modes).

Sound? Yikes. Sixteen-bit digital record/playback in resolution up to 50 kHz (better than an audio CD) in up to eight channels, with direct-to-hard-disk recording, with a DSP port allowing digital audio transfer rates of up to a megabyte per second. And STe 8-bit and ST three-voice sound will be supported, making the Falcon as close to 100% backwards compatible as possible.

Also in the copyrighted Advantage article are observations of on-board sockets that appear ready for addition of alternate CPU devices, such as PC or MAC emulators. With the dramatic speed and PC compatible video, emulation should be a snap. Other internal items included a fan and an internal hard disk--a 2.5" 40 meg unit in the one Advantage cracked open. A daughter board held 16 meg of RAM in a plug-in module.

Price? It is rumored that the Falcon 030 will start at under $700.

ATARI EXPLORER TAKES ADVANTAGE

Atari Advantage has ceased publishing operations after only three issues, as the publisher and editor have been hired to take over

production of Atari's in-house magazine, Atari Explorer. Mike Lindsay and Darren Meers are relocating to Sunnyvale to pilot the glossy bi-monthly Explorer after their short but well-received stint producing their own Atari magazine. According to Lindsay, many subscriptions were either not billed or charged in anticipation of the move. Paid subscribers will be given options on conversion to a subscription to Atari Explorer.

Lindsay and Meers were part of ST-INFORMER for four years, and both left Informer in January 1992 over a dispute regarding ownership and control. Their own magazine, Atari Advantage, had established a respectable circulation, but Atari Corp. elected not to bring Advantage in-house as an additional magazine.

The naming of editorial staff for Explorer ends months of conjecture about who would take over for John Jainschigg. John declined to move to Sunnyvale from his New York offices where he produced Explorer for the last two years.

Bringing Atari Explorer to the home offices is part of an overall consolidation of executive effort and attention at Atari. Overseeing the magazine operation will be Atari's Bernie Stolar.

LYNX GOES WEST
As Atari gears up for the Jaguar game console to be released in 1993, the Lombard Illinois offices of Atari Entertainment are being relocated to Sunnyvale. Home of the Lynx development team, Lombard will remain open as a programming center, but sales, marketing, and support for the Lynx and soon the Jaguar will be part of the California operation under the guidance of Bernie Stolar. Leaving Atari are Larry Seigal and Dana Plotkin, who did not wish to relocate.

ATARI IN FORBES
The August 3, 1992 issue of Forbes Magazine recounts the Atari story in a two-page article called "Cheap Didn't Sell" by Dyan Machan. The famed business/industry reporting magazine blames Atari's troubles on the Tramiel family's penny pinching. Machan claims that second-quarter 1992 financial statements (unavailable at press time) will be far worse than the first quarter when Atari lost $14 million on $44 million in sales. Further, the article says that Jack Tramiel has personally taken over day-to-day operation of the company, moving his son Sam out of his former office. The article does mention the new line of Falcon computers and the Jaguar game console, but speculates that Atari has less than half of the cash needed to perform an appropriate roll-out of the new products. Atari officials aren't happy with the Forbes article's tone, but some observers are saying, "Any press is more press than we have had. A lot of readers will discover that Atari is not dead, at least."

NEW SUPERBASE COMING
Superbase database systems for the Atari have been acquired by Oxxi Inc. who now offer upgrades for the popular line of software. The charge to

upgrade either version of Superbase Personal to SB Pro 3 is $85, available only through Oxxi. The upgrade includes full product, manuals and all. A new product, Superbase 4, is expected in the near future. Oxxi Inc., P.O. Box 90309, Long Beach, CA 90809-0309, USA, FAX (310) 427-0971.

NEW HOST BRINGS CD, FLOPTICAL TO ATARI
ICD Inc. has announced a new host adaptor that will enable standard ST computers to use industry standard SCSI devices, including hard drives, CD ROM drives, and flopticals designed for IBM, MAC, and Amiga. Pricing has not been announced, but "The Link" will be a self-powered molded cable-box affair that will connect to Atari's DMA (ACSI) port and plug directly to standard 50-pin centronics style SCSI ports, giving instant and complete access to virtually any peripheral using SCSI, with up to 8 devices at one time being supported. Better yet, MS-DOS formatted devices will read and write directly and transparently from the ST without modification, using ICD's driver software. CD-ROMs are now supported through The Link's extended SCSI commands, with a re-written MetaDOS driver to support the SCSI-2 standard for CD-ROM players. The ICD Link will be premiered at the Atari Messe in Dusseldorf, Germany in August. ICD is taking orders now with shipments expected in mid-August. For further information, contact Thomas Harker at ICD by phone (815) 968-2228 extension 120, or FAX (815) 968-6888.

CD's, PHOTOS, AND ATARI
Atari's been dodging the CD-ROM technology for almost three years, and now it looks like the wait might pay off. New CD technology is becoming available that makes most older disk players obsolete. The Kodak Photo CD system provides a way for consumers to have their color photographs printed to a CD in resolutions exceeding all but the most sophisticated computers and monitors. But the new format can't be read by many current CD player drives. The new system is called Mode 2, XA, multi-session capable. If you are buying a CD ROM, look for those specifications to preserve your value. New format drives might be readable using the ICD LINK (see story above) or by using ICD's revised MetaDOS on a TT or Falcon.

1059. GEMRAM now on Archive!

Newsgroup: comp.sys.atari.st

Hi all,
a new upload to atari.archive, directory new, is:
mintman3.zoo
This is a man package conatining man(1), catman(8), apropos(1) and whatis(1).
It needs nroff and a pager to be useful. Includes source & docs.
It has been written for MiNT, should work with TOS.
Enjoy!
Bye, Hildo Biersma

1061. Problems with GCC 2.1 and *80.inc/libs !!!!!

Newsgroup: comp.sys.atari.st
Date: 1992-07-28 09:44:45 UTC
From: ralph@prosun.first.gmd.de
Message-ID: <2099@bigfoot.first.gmd.de>
Source record: 219219

Hi GCC Users,

I have some problems installing gcc.
From a.a I've got:
gpincl07.zoo
gplibo07.zoo
gplibt02.zoo
includ80.zoo
libolb.zoo
libolb16.zoo
libolb80.zoo and
gcc21b02.zoo

The installation of the libraries by replacing the old by the newest one.
Compiling the next little program:

```
#include <iostreams.h>

class testclass {
public:
testclass(){ cout << "testclass::testclass\n";}
~testclass(){ cout << "testclass::~testclass\n";}
};

testclass t1;

int main(int ac; char *av[]){

testclass t2;

cout << "main up\n";

return 0;
}
```

I've got the linker error:
Undefined in malloc.o U __split_mem referenced from text
Undefined in sbreak.o U __split_mem referenced from text

What's this _split_mem ??

I added to the test program the line:

```
long _split_mem = 0L;
```

and all works!!!

Then I added an object file containing the one added line to gnu.olb by
ar vq gnu.olb split_mem.o

Try to link the older test program with the new gnu.olb, the linker
wasn't able to find the __split_mem label in split_mem.o of the gnu.olb.
Why? What did I wrong?

calling : cc -v -O test.cc split_mem.o -o test.prg -lg++

all fine again!!!

Can anybody help me on this ?

Hi!

First of all: i can't help you on that problem because i am not using
CrackArt - but the facility to grab pictures out of other programs are
one of the things giving CrackArt his name.... There exists another
package to "steal" those graphics much more effective (no problem to find
even well hidden and packed graphics). These tools are NOT released as
public-domain/shareware! Please contact the authors of CrackArt for
further ionformation.
The authors of crackart have currently no internet access. You may contact
them directly via normal mail (or phone). The adresses are included in the
docs.
Because they haven't seen even a penny for their program, they are not much
interested in supporting shareware anymore... :-((
A lot of people have asked questions about CRACKART, but it seems nobody
is able to offer a few dollars for it... (perhaps YOU - just reading this -
might change this)
Both of them are programming on PCs now (commercial).

If you are not able to contact the authors, you can drop me a note. I will
forward them to Roy (but it may take some time - so please be patient).

Bye,
Wolfgang.

>Does anybody know if MultiTOS supports Threads (Lightweight Processes)?
>--
Since the MultiTOS will be based on MiNT, there will probably be a support
for threads, that means processes running on the same text segment.
But the problem with this is that you have to program really reentrant:
you mustnt use global variables, so most libraries have to be modified,
i.e. the malloc() function.

> To be fair, I guess that many of the people who write these programs aren't
> aware that the US has a different video setup...
and some good points about US sources of software.

I just wanted to mention again that Fire and Ice works when you
change the video to 50 hz (and the program to do that is included
in that same issue of ST Format.)

Also, I went back to the April? issue of ST Format to try
to extract the Penguins game, and experienced the same problem on my
STe (would not extract - it claimed the diskette was write protected);
however, it DID work on my STfm (tos 1.0), and the game extracted
successfully on the first try on the older machine. Its an STe or tos
problem.

I am actually quite pleased with ST Format, but I am a general user,
not a power user.

I wanted to thank all those who have responded to my question
about being able to use a regular (not-specifically-fax) modem
as a modem via some special software. 100% of the responses
have said "NO" in some form or another.
The only reason I asked the question in the first place was
that a friend of mine (who is not necessarilly all that
computer-literate) believes he read an article about some new
software in the msdos world that in fact does let one use a
regular modem to send faxes. Oh well, either he's wrong, or
it just isn't available for other platforms yet....OR, there's
something slightly more going on.

>> Do I need to get some utilities which should be put in a bin directory

>Exactly that. You should use the GNU file utilities (for pwd you only need
>`alias pwd cd').

It is working under mintshel.prg but on any other real shell it will not.
The following is working under the most shells also under mintshel.prg:

alias pwd 'echo $CWD'

Under ksh it will be:

alias pwd 'echo $PWD'
alias echo 'print -r'

>It has been written for MiNT, should work with TOS.
>Enjoy!
>Bye, Hildo Biersma

European Netters: It is also available from our Atari archive.

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get 'mintman3' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
file: /pub/ATARI-ST/mint/mintman3.zoo

--> How to get 'mintman3' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.

| Please use a VALID DOMAIN ADDRESS.
| Use 'hip!hop!user' if you must.
| Never use an address which has both '!' and '@' in it.
| Bitnetters use user@host.bitnet

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE _YOUR_ ADDRESS)
send ATARI-ST/mint/mintman3.zoo
end

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you

first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level
directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service
and/or the mail-server, feel free to drop me a line (by e-mail, please).

Enjoy,
Ate Brink

Message-ID: <1992Jul28.154932.20213@sae.com>
Source record: 219228
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.os.minix

I downloaded the ST and PC upgrade kits and took a peek at what is in them and read through the "INTRO" file from the ST upgrade. My question is this:

Its not clear from the "INTRO" file whether I should use the "include/sys" cdiffs from the PC upgrade. Step 3 says
"apply the include changes from cs.vu.nl However, keep your old a.out.h, stdio.h, ctype.h and signal.h. Do not apply the include part from this upgrade!!"

What does this mean??

Has anybody tried to upgrade to 1.6.16??

|> Anyways if anyone knows of a good way to view gifs on the ST please inform me. THANKS,
|> email: chuj@horton.colorado.edu
|>

Well there is a program to convert gif to spectrum-format. It's called DMJGIFF or something like that and is available from a.a.u.e.
Fastgiff is fair program for showing gifs on ST. The problem is that ST's color and resolutions is just too poor for most gifs. Converting them to spectrum improves things but not to the extent that could be expected.
I have never heard of a program for gl's.

/Mehrdad Ravanbod

Actually, last night I learned that new publishers will take over Atari Advantage, according to Rob Robinson from AA on GEnie.

What confusion! I guess the best thing to do is just to wait 'till the smoke clears.

|> there must be thousands of gifs around.
|>
|> Thanks, Hendrik Jan Bosman (hjb@th.vu.nl)

The best alternative I know of is using the PBMPlus tool kit,
available from many places (including executables on a.a. in the
"printing" directory, of all places). The FAQ for alt.binaries.pictures
also gives more details on locations for PBMPlus.
You might also try CrackArt, which is also available on a.a.
Both the solutions I mention above do LOTS more conversion types than
just between PI3 and GIF, by the way...

>and European software are becomming very few.
>

Whenever someone says that, I'm curious what kind of software they're looking for. I've got software that I don't even have time to use, and none of it is games.

So, Len, what kind of software are you looking for that isn't currently available? If anyone else wants to jump in, please do. :^)

Actually, one might think that in a small market such as the ST's, everyone would hear about a product right when it was released. Unfortunately, the press and the developers selling the product don't always seem to walk hand in hand to get the word out. There's a new image manipulation package out from Canada (I think) called INVISION Elite. There's good support for it on GEnie, but it seems the only ones who know about it are on GEnie. I don't recall if any of the on-line magazines ran a press release on it, although there was a GEnie Real-time Conference on it recently, so that may have been included in a magazine. There's an excellent demo of it with sample pics that I would upload to atari.archive, but I don't have FTP access (at least to send I don't). If someone wants to send it to atari.archive, I could probably uuencode it and send it your way.

INVISION Elite is real high-quality stuff. Apparently, Mario Georgio from DMC Publishing (ISD Marketing) loves it.

Hi-

I recently obtained sozo133i.zoo, sozobon.zoo, sozoinit.zoo and sozosun.zoo
from a mail server in the Netherlands (I don't have FTP access).

Questions:

1. Is this all I need to get started (I would imagine that
sozosun.zoo isn't even necessary)?
2. If not, what else do I need and where can I get it?
3. Is Sozobon C even worth the trouble to set up?

Thanks in advance...
John

In article <1992Jul27.122717.20063@crc.ac.uk> naffara@crc.ac.uk (Dr. N.A. Affara) writes:
>Can anyone tell me what the difference between SCSI (1) and SCSI 2 is?
>Or for that matter the difference between SCSI and for example IDE?
>(apart from the fact that they use different connectors)

Sure.

SCSI-1: First SCSI standard - specified an 8-bit bus that has a peak throughput of 4MB/s, with a maximum of 8 SCSI devices possible (though one is designated controller with the other 7 slave devices). It uses a 50-pin ribbon cable or a 50-pin Centronics style cable, or Apple uses a 25 pin cable.

SCSI-2: Next major release of the SCSI standard. Specifies 16-bit bus (but can handle 8-bit devices for backward compatibility) and, between two fully SCSI-2 compliant devices, can reach peak transfer rates of 16MB/s, with a sustained transfer rate of up to 10MB/s. SCSI-2 provides for multiple accessing of devices on the SCSI bus - data can be written from one device to up to 7 other devices (SCSI-2 maintains the 8 device limit) simultaneously, but they all get the same info. I believe (not sure about this one) that each SCSI-2 device can become bus master, so DMA between SCSI-2 devices is possible. SCSI-2 uses the same cabling as SCSI-1.

IDE: This is the successor to the MFM/RLL drives. It can pretend to be any MFM/RLL device of the same (or lesser) size, and will automatically translate the heads/sec.per track/cylinders to the correct values of the media transparently to the computer. It is an 8-bit bus, with maximum 4MB/s (I think, but never saw it of course) with a maximum of 2 devices that can be connected to the same controller. Their primary advantage is the cheap cost of manufacture (and the subsequent cheap resale price). IDE uses a 40pin ribbon connector (I have yet to see an external IDE drive, so that may be the only valid type of cable).

Sozobon 1.33i is very easy to install. I think it is useful for small
to medium sized programs that are to be Atari-only. Otherwise, use GCC.
No, sozosun isn't needed - it is a patch to make a cross compiler for
Sun machines. Last time I checked it didn't even work with the current
version of Sozo C. Anyone know if it has been updated?

Hi there,

Can somebody encode some copies of printer drivers for First Word Plus
and Degas Elite compatible with a HP LaserJet Plus, and either post them
to me or to comp.binaries.atari.st....

Is there a repository for such items somewhere in the net.world or ftp.world?

Many many many thanks in advance.

This is what is causing most of the trouble. PLEASE people, scrap all the
old version and replace it with version 2.1 clean-slate. If you really
want, keep the old version (renaming the directory to GUMBY.GCC, for example),
but DO NOT mix them. And you DON'T need to add any symbols to gnu.olb, if
the linker says one is missing, the problem is you set-up. Flaky hacks like
simple adding blank versions of the symbol is just asking for trouble (eg.
maybe "split_mem()" is only called when you use up 128K of heap space?!!?!!

>to see the text at the screen.

Any DVItool should suffice. The probable trouble is that you aren't using a high enough magnification. Usually, the tool will require fonts of the magnifications you require. For example, with the set-up I've just started using (((CS-TEX - very nice - and only took a few minutes to install - once I gave up on their "install" program which has very bad LHArc capability))), it defaults to 96x96dpi. This is pretty low resolution. But I should be able to use the 180dpi fonts (normally used for printers) to double the screen display resolution. This should work - but I only installed it at 10pm last night, so I haven't tried much - I got an excellent printout from my BJ-10e though. Nice. All I need is more fonts, and I'm getting those from Uni today (the fonts are all compatible - and they take a long time to generate on the old ST!).

Mixing this up on my installation, that's my fault. But there wouldn't be
any problem, if there was the startup.zoo containing the new crt0.o,gcrt0.o,
mcrt0.o and mgcrt0.o.
Jwahar J. Bammi said, that this and the update to Patchlevel 82 will
be as update23.zoo as soon on a.a.

> J.J. Bammi O-TONE
>i forgot to answer this: _split_mem is an internal variable that indicates

>other address space has'nt been touched.

So split_mem is a variable set by the startup code saying that the malloc
function has to regard the splitted memory modell like the TT.
But why did my hack (appending an object file split_mem.o including
"long _split_mem = 0L;"
to gnu.olb with <ar vq gnu.olb split_mem.o>) NOT work???

Where is the fault?????

1100. PSU problems on a UK ST.

Newsgroup: comp.sys.atari.st
Date: 1992-07-29 12:01:18 UTC
From: amcalind@cs.strath.ac.uk
Message-ID: <10095@baird.cs.strath.ac.uk>
Source record: 219271

Since this is the 'techie' newsgroup, I wonder if you can help me with a _very_ strange hardware problem I've been having.

My three year old STFM has had problems with the power switch freezing up before, so I had started powering it up at the mains. Recently, though, a more sinister problem has been happening. The computer is simply switching itself off, at varying intervals. Sometimes it can be after three minutes, sometimes after three hours!

It isn't a loose wire, since it can happen without it being touched. Since the machine is well out of warranty I opened it up last month to have a look. The PSU board looked pretty complicated, so I left it well alone. And funnily enough, the machine worked fine - for about a week.

Now its up to its old tricks. I've seen adverts with new PSU boards costing over 50 pounds - which I wouldn't consider investing in a machine which I'm going to replace in the pretty near future.

So, is there a quick fix for this problem. Or do I need a new PSU?

Could you send replies by mail as well - since I only get in once a week, and they've usually cropped the messages by the time I read them.

Thanks in advance.

Tony

PS. This is a UK market, 240 volt ST.

1104. Sound sampling on STe

Newsgroup: comp.sys.atari.st
Date: 1992-07-29 13:45:22 UTC
From: rob@lillee.cs.curtin.edu.au
Message-ID: <rob.712417522@lillee>
Source record: 219267

I havent been tuned in to this newsgroup for a while and I am no great technician, so excuse me if this is out of date or silly.

The STe's include analog joystick ports, which I assume means they have a couple of A to D converters in there somewhere. Would it be possible to use these for sampling sounds? My thought was that it would just be possible to hook up and audio source to one of these and sample away, possibly requiring some sort of buffer circuit. Any reasons why this cant be done? If not, has anyone done it, if so, what hardware and software did you use?

Would it be difficult for some third party manufacturer to make a
SCSI->ASCI adapter for such things as Atari laser printers? Maybe Atari
will come out with a SCSI version of the SLM604... then (with software)
it could work on clones too!

Gerry, let me assure you that there is no magic IBM program to transform the hardware of a data modem to fax. The fact of the matter is that there are NO software tricks that can only be done on an IBM.

Have you noticed that Atari, Amiga and Macs can all emulate a MS DOS machine in software, where the IBM requires hardware to emulate anything! It is, however, a common misconception that some things can be done only on an IBM PC.

>On the Falcon the ACSI interface is removed and there's only SCSI harddisk
>interface left.

This is true. But according to most (_unofficial_) reports, the falcon sports an internal IDE drive. Therefore two drive interfaces. Of course, it doesn't sound like you will be able to do much in the way of expanding it unless you (like so many have done) rip it out of the small case and put it in a bigger, beefier, and more manly AT-case that has more pumpitude than the girly-case that Atari will use. Yah - ya know? Besides, you could only use at most two IDE drives anyway. Pretty wimpy. (For all you non-SNL fans, pumpitude=power and girly=wimpy=underpowered. "Hey Hans, maybe we should flex." "Nah, we don't want to break their little-girly monitahs, ya know?")

BTW, I am glad that they went whole-hog and put in SCSI-2 - the only way to go at this point - but I don't know about taking out the ACSI port. I mean, it might be different if the SLM604s had come with a SCSI interface, then going to pure SCSI external devices would have been a natural next step, but as it is, they will be leaving a lot of Laserprinting users high and dry (except of course for those who either have non-atari laserprinters hooked to their (egads!) parallel port, or have non-atari laserprinters hooked to the ACSI port via host adapter (those are the guys that will whether this ok)). Of course, perhaps the wizards at ICD will be able to save their bacon by making an ACSI<->SCSI converter (I assume that presently available host adapters will _not_ work as I don't know _that_ much about the mechanics of SCSI/ACSI).

Two years ago, Sagrotan was a good anti-virus-programm. V4.17 is the last shareware-version (there exists now a comercial version) and to old to find newer viruses.

Try to get Virendetector >=V3.1 from Volker Soehnitz, its Shareware and up to date (docs are in german, too).

Ciao

|> Tim Wright.
|> wrighttj@cs.aston.ac.uk

There is a Norwegian who has translated Sagrotan version 4.14 into english. His name is Stein Arne Jensen. This english version also include a brief documentation in english. He is running a PD library and has lots of other nice software as well. The adress is:

STUG Norway PDL
c/o Stein Arne Jensen
N-3630 Roedberg
Norway
Phone: +47 3 741473

Send him a diskette and an envelope with your own adress on (return adress) and he will send you the goodies. He also has ver. 4.17 (in german) and the differences are minor (the difference is explained in the docs).

BTW: Sagrotan is now a commercial program in its newest version (5.# ??).

I came into this thread while it was winding down......

I've just run across a game that I've never heard of for the 2600 --
Sentinel (copywrite 1990!). Bought it, and found that it requires the
2600/7800 light gun.

I have a NES light gun that's hackable -- I don't own a NES anymore. Anyone
have a 2600/7800 light gun, and want to clue us all in on the details? I'm
not going to run out and buy a light gun to play this one game.

Source record: 219284

Ed,

:) ....Since you asked... the software I'd want to see o the Falcon that we dont have are products like PhotoShop and ColorStudio. Retouche Color& Design comes kinda close, but costs $2,000, and doesn'thave al the features of PhotoShop of Colorstudio, and they sell for between $350-500, depending on where youbuy the packages from.

I'd also like to see the CD ROM references available on the ST/Falcon line. I'd like to see something like the Mac CD FunHouse available for Atari owners. I'd liketo see the EPS clip art colletions available on the new computer. I'd like to see a more flexible database than we have ow with SuperBase Pro and Tracker. Anew spreadsheet program would be nice.

Finally, I'd liketo see some of thw wiz-bang new ames available for the IBM and Amiga platforms come over to the Falcon -- after all, Atari is suppsed to be a game system, and we aren't even getting new games. :(

(don't blame me..Ed asked :))

PH> maybe it's
PH> more complicated than I thought, being as I got no replies. I just wanted
PH> to know how to pass parameters to a .TTP program, specifially using GFA
PH> Basic, if possible.

Sorry, I must of missed your post. Normally, I answer what GFA questions I can as soon as I can.

Assuming your program is named "OPPS.TTP" and is in the current directory, you can pass the command string "Hi There" this way:

```
a%=EXEC(0,"OPPS.TTP","Hi There","")
```

a% will contain a 0 if everything went all right, or a TOS error code if TOS had a problem, like finding the OPPS.TTP program. If the program you ran returns an error code, a% will contain that.

If "OPPS.TTP" isn't in the current directory, simply add in the appropriate drive and path inbetween the quote marks (i.e "C:\OPPS\OPPS.TTP").

The third set of quote marks in the above example are for setting enviornment strings. Personally, I've never had much luck with that though, so I generally just leave them as empty quotes as I did above.

Re-reading your message, I see that you might be asking how a GFA program can read in a command line passed to it, rather then having GFA pass a command line to another program which the above discribes. This too is rather easy:

```
command$=STRING$(0,255)
BMOVE BASEPAGE+128,VARPTR(command$),255
```

command$ will now hold whatever commands were passed to your GFA program. The command line, if less then 255 characters long, will be null filled (CHR$(0)s) in command$, so you will probably want to 'trim' it to just what the user entered by using:

```
command$=LEFT$(command$,INSTR(command$,CHR$(0))-1)
```

Hope this helps, sorry for the delay.

>to use these for sampling sounds?

They are probably MUCH too slow. Remember (?) the 8-bit had paddles also -
they worked by measuring the time it took to charge a capacitor - measured
in "lines of the screen". ie. updating every 50Hz. I actually made a
sound digitiser for the 8-bit by doing this myself with a smaller capacitor,
and by utilising the 8-bits ability to *output* and input throught the
joystick ports. But I don't think that is possible (or advisable - I blew
up the GTIA on my 8-bit) on the ST[e].

From: azog@world.std.com
Message-ID: <Bs6oou.35K@world.std.com>
Source record: 219288

I finally ftp'ed the Hermes stuff the other day (over 600k, not bad ftp'ing it, but bad downloading it at 9600 PEP!), and am sorta in a bind...

I cant read or speak German, and most of the important docs are in German. Ive set things up to the point where I can send local mail, but when I try to send mail to my Unix box, something must be wrong with the xhosts file, cause it complains.

Has anyone got an explaination of all the fields? I tried things out by using the examples supplied, but still no luck...

One last quick question. Is there a cron that can be run under MiNT? when I sent local mail, it spooled up under the mqueue directory, but I needed to issue rmail by hand before it got delivered.

Thanx

: >and European software are becomming very few.
: >
:
: Whenever someone says that, I'm curious what kind of software they're
: looking for. I've got software that I don't even have time to use, and
: none of it is games.
:
: So, Len, what kind of software are you looking for that isn't currently
: available? If anyone else wants to jump in, please do. :^)
:
[stuff deleted]

What kind of software? How about:
Monkey Island II
King's Quest V
Indiana Jones - Fate of Atlantis
Wing Commander II
Falcon V3.0
Sim Ant
Aces of the Pacific
Battle Isle
plus almost any future release of American software companies and most
European companies including:
A - Train
Darklands
Sim Farm
Sim City 2000
Strike Commander
Leather Goddesses of Phobos 2

I don't want to start any discussions about how good some of the games
actually are or if they are worth buying at all. The point is that you
don't have the choice because as far as I know there will never be an
ST - version of them.
The decision wether I am going to buy a Falcon or not depends on how much
software support it will get. It can only be successful if there is
enough support.
I hope there are not too many ST users out there who share your opinion

that there is nothing to worry about.

See ya, Stefan

I think that Atari has already announced the SLM 406 on the CeBit in Hannover last March. And that printer is supposed to HAVE an SCSI interface.
Please correct me if I am wrong.
And manufacturing an ASCI/SCSI-adapter shouldn't be a big problem (I hope so!)
Anyway, it would be only of use for older Atari laser printers. Hard disks are no problem, since only the host adapter has to be removed.

From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Jul30.084657.11372@sactoh0.sac.ca.us>
Source record: 219299

I've been agonizing over this point, but I have not found many answers, so here goes.

The price of 14.4 kbps modems have dropped to (relatively) cheap levels in the past year, and now the ones I have seen are "only" $150 more than the 9600 bps modems. But most of the terminal programs that I know of only have a 9600 bps setting, then it jumps to the 19.2 kbps setting with nothing in between, namely the 14.4 kbps setting.

Does anyone know of a program that uses the 14.4 kbps setting?

Interlink ST- no
Transfer 1.2 (.ACC)- no
Atari TOS 1.2 control panel- no

Flash? GIME terminal? VT-100 even?

(Don't use baud anymore- with high speed modems, the term becomes inaccurate. bps (bits per second) is the preferred convention)

Seen at Weird Stuff Warehouse, they have opened 5200 games for only $1, yes, one dollar.

Not a big selection, and no instructions, but then again, the gaems are classics, and for the most part, instructions aren't needed.

By the way, I checked for the Atari 800 video monitor cables with the BNC connectors, and they were gone (!?!) Now who would go and buy them up?

For those fortunate enough to live in the Bay Area, they have a few games for other platforms, ST games and a box full of a Karate games for the 2600 for 49 cents.

Here's the address"

Source record: 219296
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

(Cross posted to .st, maybe someone remembers)

I saw this at B&C Computervisions in Santa Clara, an Atari 1029
printer. It's a dot matrix printer, it looks like a C. Itoh
Prowriter (?) clone.

Does anyone know anything about this printer?

As I recall, Atari never offered the 1029 in the US, I never saw it
in any literature, or saw it at Federated.

Was this an unreleased prototype, or a printer for the European
market?

The 8 bit printers that I know that were released were the;
820 40 column dot matrix
822 40 column thermal, with plotting
825 80 column parallel
1020 color plotter
1025 80 column SIO
XDM121 daisy wheel

Hi People,

I imagine someone has asked this already, but perhaps I wasn't listening... ;-)
Is there a translation (into English) of the CS-TeX documentation?

Cheers,

[M][a][r][c]

Yes, of course you need a MS-compatible mouse-driver e.g. mouse.sys
or gmouse.com....

1133. Atari ABC 386 SX/DX II

Newsgroup: comp.sys.atari.st
Date: 1992-07-30 09:30:37 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Jul30.093037.12142@sactoh0.sac.ca.us>
Source record: 219300

Does anyone have any information on the Atari IBM compatibles, the ABC 386 SX/DX IIs? Other than from the brochure, does anyone own one of these?

From what I have seen of the computer, the one place I saw it oinly had the 386 SX and they were selling it for $750, no monitor. Is that the going price for 386 SX systems?

(386 SX II, 1Mb RAM, Phoenix BIOS, SVGA 800x600, 40Mb HD, 17ms access, 3.5" 1.44Mb floppy, three open drive bays, two 8bit slots, four 16bit slots, MS-DOS 5 and Windows 3, 200w power supply 110/220v, parallel, game and two serial ports, 101 key keyboard)

Is this a decent system?

The reason I ask, is that one might have to get a real IBM type, and instead of screwing around with emulators, at least stay in the family and get an Atari.

Personally, I'd probably rather use the original GEM program (I have it) for the IBM and feel right at home, or move to OS/2 (I won that program...)

From: am@Materna.DE
Message-ID: <am.712489781@materna>
Source record: 219293

Hello you all !
Does someone knows something about MINT for Atari ?
What it is, how to use, where to get and so on.
Please post your knowledge here or send me a mail.
This time I use an Atari Mega St 2 with 30 MB Hard-
disk. Is it poosible to use MINT- is it perhaps a UNIX
like shell ? Or what is it ?

>to split across disks (I just don't let it split them for now).

try ftp tupac-amaru.informatik.rwth-aachen.de (137.226.112.31) - there is a
file /pub/atari/vault30_OK.zoo which contains a patched version of Vault 3.0
which does not have the 'ping-bug' together with 'The Key'.

1136. New STETRIS and COLUMNS available at Newsnet...

Newsgroup: comp.sys.atari.st
Date: 1992-07-30 12:36:09 UTC
From: arend@leonardo.et.tudelft.nl
Message-ID: <1992Jul30.123609.13072@donau.et.tudelft.nl>
Source record: 219298

Dear STETRIS and COLUMNS players,

The previous versions of STETRIS and COLUMNS were satisfying, but had some
weaknesses/bugs. De versions published in de comp.binaries.atari.st news-group
are updated with the following features:

- The most important feature is the 3D-look in which the whole user-interface
is formed.
- The background of the screen can now optionally be filled with an image
instead of the boring bars. The image should be in the 32000 byte or STAD
format and should be called columns.pic or stetris.pic. When no such file
is present, the boring bars will appear again.
- The game status/scores/settings can be saved. A switch is present to turn
on automatic saving of status when exit.
- There are also new switches for turning the info window on/off and setting
up your own play-screen by setting the help/next/blockmeasure-windows
open by default or not.
- There is also a button to send the contents of the info-window to a printer.
- The info-window scrolls now synchroneous with the machine-timer.
- Some blocks are added to skill 5 in tetris to have a complete set.
- Name dialog box has delete, backspace, arrow-left/right and arrow-up/down
(increase/decrease ascii-code of character under the cursor) available.

I'm sure you'll have a nice time playing these games. Reactions can be send
to the E-mail address below or to the address in the info's.

Greetings, Paul.

1137. vault vs. 1.6M disks (a guess), tar on floppies (was: PD HD Backup...)

Newsgroup: comp.sys.atari.st
Date: 1992-07-30 14:13:26 UTC
From: nox@jelal.north.de
Message-ID: <2109.07.92@jelal.north.de>
Source record: 219002

In <1992Jul27.122910.5145@aston.ac.uk> wrighttj@uhura.aston.ac.uk (Auntie Tim) writes:

>Well, thanks for the replies about a decent hard drive backup
>program. Loyalty seems to be divided pretty equally between
>Vault and Turtle, so I've pulled them both and tried them out.
>The thing is, they both only accept standard format disks- since
>I've got a high density drive it would be nice to be able to
>back up onto 1.6 Mb disks and halve the number of disk swaps.

have u tried formatting the disks before and then setting vault to
`don't format'? i'm not sure about high density but for those `strange'
10 sector formats etc that worked just fine... only thing is it didn't
like 1 sector per cluster if i remember right. (if you need a good
formatter program, try a recent version of PumpUp from Claus Brod.)

> I
>heard that Diamond Back did this, but it isn't PD. Anyone know
>of a PD program which can use high density drives? TIA...

well the _fastest_ backup program i know still is tar. so if you're
not afraid of CLIs, try GNU tar (on a.a)...but do read the docs first.
(this is `the' general archiver on un*x, works on files, tapes,
disks...everything you have a driver for. the key to speed on floppies
is to increase the block factor (-b), only problem is it has to be a
factor of the disk size, ie no._blocks / block_factor must be an
integer or else multivolume archives (more data than fits on one disk,
-M) don't work. at least this was so with an older version, don't know
about the latest.)

remember, be sure you get GNU tar, all other atari tars i have seen
are a joke at best...

ah, one other thing: if you want to exchange tarred floppies with un*x
boxes then you need a `raw' floppy driver like ps0.zoo in a.a's mint
directory (needs MiNT). if that is not an issue you can just write
files, then you only lose a few blocks. (ie tar cfvb a:/something.tar ...
instead of tar cfvb /dev/something ...)

and, cause that just happened to me: beware of bootsector viruses,
the `bootsector' on raw tarred floppies is the tar header of the first
file! (at least then tar still gets the other files out, unlike other
archivers...)
>--

>(This time from ST Format)

I read the bit about the Falcon in ST Format too. (Note: I didn't buy the purile rag I just read it in the shop). They asked various developers what they thought about the machine and I just have to take my hat off to Mark Pearson of Protar who basically said that if Atari market this as a games machines then it's dead. I couldn't agree more. It is an amazing machine and I will be sad to see it get flushed down the toilet by Atari's usual marketing strategies.

From: selick@csa.bu.edu
Message-ID: <92355@bu.edu>
Source record: 219102

I just had an interesting idea. Now that we're all done chastising Atari for not advertising their products properly, why don't we, the members of comp.sys.atari.st, and for that matter, the entire Atari community, advertise for Atari? What I am saying is: Get out your favorite DTP program and your Atari SLM's, and go out there and advertise! Go post your advertisements on your local bulletin boards (physical ones, not electronic ones!)

Ok. Here's another idea...

Why don't we all pool our money and get, say, $15,000 and give it to Atari to take out an ad in TIME, or Business Week, or something like that? Maybe that would get the ball rolling? We have to be innovative...we own Atari's!

-Steve <selick@csa.bu.edu>

:EMILY:
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of
humor.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways),
Emily has taken time out of her busy schedule to answer a few commonly
asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.
Flame wars are fun. They're the main reason people creted Usenet,

and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV:
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

--

Mark Leair

:MAGS:
What magazines are available for the Atari ST?
==========

The information here is preliminary. If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.
As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011 Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2, D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

:TIPS:
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning

of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window. (I've been told this will work on 1.2, and possibly other TOSi.)

:ZNET:
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR:
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user
magazine are also available from the atari.archive server under
/atari/magazines.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

```
begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end
```

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

```
user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>
```

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

cs.uni-sb.de [134.96.7.254]

archive.cs.ruu.nl [131.211.80.5]

:COMP:
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that might be of use to Atari ST users. Please send me addresses for the blank ones on this list. See also IAAD, it lists many more companies that are not on this list.

Archive-name: csas-faq/part2

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

WEL Welcome to comp.sys.atari.st
ARCS How do I deal with Archived files (.ZOO, .ARC, .LZH)?
CLI What Command Line Interpreters are available?
ERR What does TOS ERROR nn mean?
GDOS What is GDOS, and where can I get it?

MAIL E-Mail file servers
*FTP Anonymous FTP servers
TEX Is TeX/LaTeX available on the Atari ST?

:WEL:
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
```

comp.sources.atari.st ! uuencoded/shar sources

:ARCS:
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using zoo21.ttp.

:CLI:
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell - available under MINT

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4

```
Bad request.....................-5
Seek error......................-6
Unknown media...................-7
Sector not found................-8
No paper........................-9
Write fault....................-10
Read fault.....................-11
General error..................-12
Write protect..................-13
Media change...................-14
Unknown device.................-15
Bad sectors on format..........-16
Insert other disk..............-17
Invalid function number.........-32.............1
File not found.................-33.............2
Path not found.................-34.............3
No handles left................-35.............4
Access denied..................-36.............5
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35
```

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when you call Frename and the two names you give aren't on the same drive), and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from the 68000 micro-processor.

```
Number
Description of bombs
=========================================
Reset: Initial PC2..............1
Bus Error.......................2

Level 7 Interrupt Autovector....31
Trap Instruction Vectors.....32-47
[unassigned, reserved].......48-63
User Interrupt Vectors......64-255
```

:GDOS:
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

:GNU:
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2.5 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at cs.uni-sb.de and most other European FTP sites. The latest version of GCC available for the ST is 2.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM:
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)

Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG:
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
ICON
LISP
Modula2
OPS5
perl
PROLOG
SCHEME
Smalltalk
XLisp
XProlog

XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX:
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT:
What is MiNT?
==========
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM program along with a lot of character-based programs simultaneously. MGR

and MW2 can both put multiple terminal windows on screen, and bgacc can
put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go
with it can be found at atari.archive.umich.edu:/atari/mint.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking
OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now
'MiNT is Now TOS'. :-)

:DEMOS:
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably
need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from
atari.archive to allow this.

:PAINT:
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access

via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
----

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

cs.uni-sb.de [134.96.7.254]

archive.cs.ruu.nl [131.211.80.5]

:TEX:
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty

The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program
that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:DRIVES:
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup

SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again. And check the jumper setting on the drive (consult the drive's manual). If you are using more than one drive with the system, make sure only the last drive has the terminator (either a DIP or a signle inline package of resistor, which usually is socketed and close to the SCSI connector on the drive circle board. Remove the terminator from other drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5 from ftp sites.

:FLOPPY:
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe and TT machines. If you own an older Atari ST, there is a company which offers a $199 kit (including floppy) to install and use the drive. (I will supply the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the desktop.

:GRAPHIC:
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass at listing some of them. The information is based on postings by Ben Gilbert and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different graphics boards available, from hobbyist to professional, from CAD to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY:
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM:
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

:MONITOR:
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150,

used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM:
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE:
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases. The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE:
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

1144. Re: 14,400 bps terminal program

Newsgroup: comp.sys.atari.st
Date: 1992-07-30 16:21:41 UTC
From: wwc@vsnhd1.cern.ch
Message-ID: <1992Jul30.162141.26279@dxcern.cern.ch>
Source record: 219106

Hi,

you asked for a terminal program that is able to install a 14.4 kbps setting.
Under normal circumcances this is not very usefull as the flowcontrol between
modem and computer will handle the problems which are seen at first sight.

Nevertheless the terminal CoNnect can handle 14.4 kbps on Modem2 and Serial 2
of a TT or Mega STE.

Of course it is capable of VT100, Vt220, and ANSI...

Wolfgang

>Atari to take out an ad in TIME, or Business Week, or something like
>that? Maybe that would get the ball rolling? We have to be
>innovative...we own Atari's!

I don't think $15,000 would be nearly enough for an ad in Time, but I could be wrong. That seems like a low figure for a magazine with such a huge readership. Anyway, what they need is a few billion to buy ads during the Super Bowl. Atari might be able to revive themselves with McDonalds' advertising budget.

Dave Baggett

>-Steve <selick@csa.bu.edu>

I couldn't agree more. The main problem is getting people organized... I certainly wouldn't mind donating a few bucks, if a fund is set up & I know it'll be put to good use.

Hmmm... anyone know of any other company that leaves it up to their customers to advertise?

Dan Aylward

JMW>
JMW> I managed to get cla to run, but only if it was in the root
JMW> directory of the drive - fine if you are using floppies, but
JMW> useless if you have a hard drive. Did anyone else experience this?
JMW>
JMW> --
JMW> John M Williams, Faculty of Medicine, University of Tasmania
JMW> J.M.Williams@med.utas.edu.au

I extracted to the root of my E: drive by using the following
commandline for LZH201D.TTP:

x -rm cla1_v1.lzh e:\

and didn't experience any problems. I then copied all CLA-related
files to a folder called E:\CLA, and the program still ran properly.
Watch your memory usage, though. I have a 1MB machine, and CLA won't
run unless I clear out all accessories, etc.
Hope this helps.

Grant

This looks like the beginnings of another section of the FAQ, or even its own list. Would you be willing to be the KotL for this info? I'm sure newcomers would be interested in a list of all the major products for the Atari 8-bits along with a one-line description, starting with the products of Atari itself. This should also include such almost products as the 1450XL. Or does this list exist somewhere already so that I'm just displaying my ignorance?

>levels in the past year, and now the ones I have seen are "only"
>$150 more than the 9600 bps modems.

Actually, I saw an ad in MacWorld (August) for a SupraV.32bis (a 14.4kbps modem w/v.42bis etc.) for $295! What a deal - and it's less than what I have seen for some 9600bps modems. I don't know if it supports MNP5 though (which is of course what my University's dialups use - sigh).

>But most of the terminal
>programs that I know of only have a 9600 bps setting, then it
>jumps to the 19.2 kbps setting with nothing in between, namely the
>14.4 kbps setting.
>
>Does anyone know of a program that uses the 14.4 kbps setting?

Don't worry about it. If the modem supports the V.42bis protocol, then it will be able to handle a minimum of 57.6kbps - and just about anything slower - because of the compression gains. If it supports MNP5, it will be able to handle _at least_ 28.8kbps for the same reason. You don't have to worry about anything beyond what speed is acceptable between modem and computer because the modem will regulate what it does to connect to the other modem. So just go ahead and lock it into 19.2kbps (or higher if you can) and even if the modem has to step down to 1200bps, don't worry about it - the buffer in the modem will handle everything (the modems may communicate with each other at 1200bps, but the modem-computer link will work in bursts of 19.2kbps or whatever you set it to). As such, _all_ of the programs you listed should work. Just make sure they support RTS/CTS and that you install a CTS fix program if you have a TOS before 3/2.06 (although, I think TOS 1.2 may not need it - install the fix anyway as most should tell you if it is unnecessary or not).

>
>Interlink ST- no
>Transfer 1.2 (.ACC)- no
>Atari TOS 1.2 control panel- no
>
>Flash? GIME terminal? VT-100 even?

What about Uniterm - great vt52->vt200 emulation! Maxs out at 19.2k though.

>(Don't use baud anymore- with high speed modems, the term becomes

>software did you use?

You *might* be able to do this, but why? The joystick ports can't have very high
resolution, bit wise, and there is now software that allows 8, 12, and 16-bit
sampling, in stereo, on the STe. The 8-bit samplers aren't even that expensive.

>Atari to take out an ad in TIME, or Business Week, or something like
>that? Maybe that would get the ball rolling? We have to be
>innovative...we own Atari's!

Although I would like to see Atari succeed, and I do think that they
should do a bit more advertising, this is _not_ the answer. For one thing,
if Atari wants to make money, _Atari_ should be doing the advertising.
I'm not going to run thier business unless I'm on the payroll.

Another thing is that one ad will not do that much. It's true that a small
sum from each Atari user on csas would pay for a small ad in some magazine,
but it would require many of these ads to have a meaningful effect. Even the
staunchest of Atari supporters would tire of donating money to Atari every
month.

Finally, what would I get out of my donation? If Atari went belly up
tommorow, I would still have my STe, my software, a community of users
here to converse with, and even a bit of a market should I decide to write
commercial software. If I gave money to Atari, and the advertising did
actually succeed, I would still have my STe, my software, a slightly larger
community of users here to converse with, and a slightly larger bit of a
market should I decide to write commercial software. And some users wouldn't
even get that much out of it. Given the possibilities, it's probably not
worth the money.

1156. Re: 14,400 bps terminal program

Newsgroup: comp.sys.atari.st
Date: 1992-07-30 18:24:09 UTC
From: nelson@that_machine.Kodak.COM
Message-ID: <3479@eastman.UUCP>
Source record: 219118

The 14.4K bps modems really talk to your cpu at 19200 bps. Through the magic of data compression (v.32/42), mnp, and all that, the real throughput of the modem is someplace between 14.4k bps and 19.2k bps. There's buffers and flow control stuff built into the modem. Just about any terminal program will work at 19.2k bps.

However, the more important question than which terminal program is the problem of flow control. The flow control in most, if not all, versions of TOS is broken, and you'll have problems with receiving data fast unless you use one of the patches like serialfx to correct the problem.

1158. Bug in Pure-C

Newsgroup: comp.sys.atari.st
Date: 1992-07-30 19:37:08 UTC
From: boender@dutiws.tudelft.nl
Message-ID: <1932@dutiws.tudelft.nl>
Source record: 219122

```
Hi,
With a friend of mine, I discovered a bug in Pure-C.
In some circumstances, variables that are declared static in a source
file (outside of any function) and that are only used in one function,
do not actually exist outside of that function. Unless: they are initialised
to a value, or the option "Do not use register variables" is set.

example:
#include<many files>

static int desk_x, desk_y, desk_w, desk_h;

void window_init(void)
{
.....
handle = wind_get(0, WF_WORKXYWH, &desk_x, &desk_y, &desk_w, &desk_h);
.....
}

Doesn't work unless option "do not use register variables" is set.
Changing the variables to:
static int desk_x = 0, desk_y = 0, desk_w = 0, desk_h = 0;
also makes it work.
This is Pure-C of sept. 20, 1991.
Has anyone seen this bug before, or does anyone know of workarounds?
Many thanks,
P. Boender
```

1159. Adaptec Controller Clock Problem

Newsgroup: comp.sys.atari.st
Date: 1992-07-30 19:49:15 UTC
From: bmaraldo@watserv1.uwaterloo.ca
Message-ID: <Bs7wE5.62p@watserv1.uwaterloo.ca>
Source record: 219115

I just purchased an ICD drive with an Adaptec 4000 series front-end
SCSI board. It has the real-time clock on it. It came with a set of old
ICD utilities that wouldn't allow for >16M partitions. So, I used the new
Atari utils. When I run the ICDTIME.PRG or TIMESET.PRG I get 2 bombs. I
can't seem to access the clock properly. Do you know why this is and how
i might be able to get to the clock? Perhaps the old ICD utils are not
compatible with the new Atari utils I used to format it (???).
Also, the manual that came with this vintage 1987 drive state that
the COPYFIX.PRG program should be in the \AUTO folder to fix the TOS bug
that doesn't update the time on copied files. Was this fixed in TOS1.4 (ie.
do I need it)?

Thanks for your help,

Brett Maraldo

From: adamd@rhi.hi.is
Message-ID: <5188@krafla.rhi.hi.is>
Source record: 219119

This is probably not the reason why your ST is broken, but the same symptoms occur if you have the monitor resting on top of the computer. I used to think it was the weight of the monitor distorting the disc drive, but the truth is that the monitor produces electromagnetic interference which messes up the signals on the flatcable to the floppy drive. Some people wrap their flatcables in aluminium foil (be careful not to short anything out) but the most effective solution is to make sure there is a big enough gap between the computer and the monitor.

Call ICD's bbs
815-968-2229

Get the latest utilities, they allow for 32Meg and larger partitions.

I prefer the 32 meg ones though... they use smaller allocation units.
I wonder what size Minix allocation units are!? Maybe I'll switch to minix format. What benefits other than flexible naming does the Minix format offer (from within tos/MiNT)????

What we would need to do is more important then giving Atari money
or passing flyers around.

What we need to do is get some kind of organized software letter
writing campaign for the Falcon & ST computers.

I'm one of those users who will BUY the software. I'm not writing
just to write.

The software will be the main factor deciding the success of the Falcon,
word of mouth is important but not until you have a good computer
WITH software.

I'd be interested in helping to get a campaign together, but only if the users that participate are REALLY willing to purchase the software. In other words, don't write, get the companies to produce the software, and then pirate it.

Over here in NZ, you are very lucky to find ANY Atari support at all, much less access to the latest stuff! (About 4 copies of Populous II got into the country! pitiful!)

Too many companies are dropping atari support, because they are releasing rubbish-rehash games that everyone already has in another form. Games such as the sim- series (Sim Ant, etc.) are original(ish) concepts, and as such, should sell reasonably well on the ST. Lemmings was basically the first game of it's type, and it was snatched up by the public in the UK by the barrelfull apparently!!

Get some addresses, and tell the companies to release some decent software for the ST, and they might just make some money out of it!

Great. Now what we need is the addresses of software companies & what they produce for other platforms. Also, it might be a good idea to write to major hardware outlets like Computer City and Computerland and tell them we want to see Atari computers in their stores. I wonder if there's a way to set letter mailing up like a pyramid scheme so dealers get inundated with letters? They'd surely listen then! :)

Does anyone have a list of addresses & products? Actually what we might want to do is go play around with Macs and clones & get an idea of what we want. Then post our findings on comp.sys.atari.st & anyone who's interested can write letters. In fact, if people post their letters here, others can use them & modify them if they don't have time to type a full letter...

Any more ideas?

I thought about this. If we really do not care to move to another
platform and would like to stick around the Atari world, we might want
to try this...

Find out the BEST music/desktop publishing software for the Macintosh.

Find out the BEST video/graphics software and hardware for the Amiga.

Find out the BEST entertainment software for the IBM compat. & Amiga.

We then make a list of all the software that we would like to
see on the ST and/or Falcon.

Then we hit these companies with letters one by one.

This way, we can upgrade to a Falcon (goodness know I'm ready) WITHOUT
having to buy all new software. I have a lot of great software
for my ST that (according to the rumors) should work with the rumored
Falcon 030 computer.

But yes, you are right. We should get a list of software/hardware
companies and what each of them produce.

```

Static variables are declared inside functions. Variables declared outside of functions are global. I'm not sure what the compiler is making of your code, but I do know of one use of the "static" keyword outside of functions, and that is in function declarations. In this case, "static" means private, i.e. not accessable to any code outside of the source module in which the function is defined.

Doesn't work unless option "do not use register variables" is set.

Very interesting, but ...

1172. HERMES - 'Insert Disk C into Drive A:'

Newsgroup: comp.sys.atari.st
Date: 1992-07-31 05:34:22 UTC
From: mike@hermes1.uucp
Message-ID: <H.o8MesY_z&CU@hermes1.uucp>
Source record: 219140

When I start up GUS and log in, I get the message 'Insert disk C: in drive A:'.
I think the message is coming from when GUS calls 'HUSH'.
I don't have any drive C: mentioned anywhere in my config.sys.

When I get the message I take out my data disk, put in a garbage disk,then
I get the message 'Put disk A: in drive A:', at which point I put in my real
data disk.

If I just ignore the message and leave my data disk in, I know from experience
that the floppy will get clobbered. (Trying to write a 'drive C:' FAT to the
floppy).

Anyone know how I can get rid of this message?

Mike

1173. Re: Passing parameters?????? 8^)

Message-ID: <20430@sbsvax.cs.uni-sb.de>
Source record: 219134

Ok, so there seems to be nobody to answer, I'll post my solution
to the problem, passing a commandline-sting to a GFA-Basic program.
It's really quite short:

```
------------------------------CUT HERE-----------------------------------
' Demonstration for passing a command line
' string to (compiled) GFA-Basic-programm
' Tobias Blickle
'

GOSUB get_cmd(cmd$)
writeln("Commandline is:"+cmd$)
END
'
PROCEDURE get_cmd(VAR a$) !reads commandline from basepage
a$=""
IF PEEK(BASEPAGE+128)<>0
a$=CHAR{BASEPAGE+129} !That's the point!
ENDIF
RETURN
'
PROCEDURE write(was$) !same as PRINT, but redirectable output
~GEMDOS(9,L:V:was$)
RETURN
'
PROCEDURE writeln(was$) !WRITE+LF+CR
write(was$)
~GEMDOS(2,10)
~GEMDOS(2,13)
RETURN

----------------------------CUT HERE-------------------------------------
```

The procedures WRITE and WRITELN I use, to get an redirectable output
when using a shell. The original PRINT-command is not redirectable.

Bye

Tobias

1174. USENET News Feed on Long Island Wanted

If there is anyone in the Atari group who knows of a usenet node (with Internet FTP access) in Nassau or Suffolk (preferable western Suffolk) counties on Long Island. Please respond to this message directly. I am looking for either a public access (none listed in pub-nix) or pay system (within reason). I moderate an Internet Digest and need to be able to mail the thing regularly and to receive the messages (sometimes heavy volume). I would use Mercury or Hermes or perhaps the unused MSDOS computer on my desk for the access.

Thanks

Robert Royar

>Does anyone know of a program that uses the 14.4 kbps setting?

The speed at which two modems connect (e.g. 14400 bps) is totally
independent of the terminal program. These programs let you select the line
speed between computer and modem, nothing else. So you should always select
the highest possible speed in your terminal program.
If you select 9600 bps and the modem to modem connection is 14400 bps you
loose performance because the modem doesn't get data quick enough to profit
from the higer line speed.

What's the problem with marketing the Falcon as a games machine? Of course
you can do a lot more with it than just playing games. And there surely
isn't anyone who tells you just to play games on it. It's up to you how you
use a machine. If you like to use other programs (i.e. no games) on it, go
ahead! Most of the existing software will run on it.

m>Does anyone know of a program that uses the 14.4 kbps setting?

What for ?

ALL 14.4 kbps modems use a DTE rate of (at least) 19.2 kbps.

This is perfectly sensible, since by use of compression (V.42bis/MNP5) modems can achieve a throughput that is higher than the physical link rate over the phone line.

That's why you have to use some kind of handshake between the modem and the computer (RTS/CTS or XON/XOFF).

A rate of 14.4 kbps would be technically possible, but it would limit the througput to 14.4 kbps unnecessarily. Using a 19.2 kbps setting can only improve performance over a theoretical 14.4 setting.

-Daniel

1178. Re: Atari marketing & the Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-07-31 11:30:33 UTC
From: s_grunwa@irau29.ira.uka.de
Message-ID: <15b88pINNc2a@iraul1.ira.uka.de>
Source record: 219139

The software problem is the atari problem, but it is a bit selfmade.
Atari has dropped the US market by selling the ST with color-display
only before it was time to do so.

In germany the ST is used by lots of students and companies and
the reputation is that of a workhouse. Like you use a typewriter
you use a ST. Plug in and work. SO most of the people using a ST
at work are not really interested in computers and don't talk
about them. They don't know about RAM, ROM, Hardisk or Resolutions.
It's just a tool, which works or not. If you ask them they are not
against Atari, but they are also not pro Atari. This lack of
corporate image makes it very hard for Atari to be considered.
Companies using Atari do not plan to drop them, since they do their
work in preparation of papers, finance and pay roll applications.

With the FALCON, Atari will start to increase their games image,
since the machines outfit looks like a Games machine and the
supported resolutions tells exactly the same story. The machine
will be very fine for programming and grafics too, but i don't
expect Atari to supprot this area. This is esspecially bad, if
i think of the company i'm working at. They use PC's as color
grafic terminals and this machines (386/25 and faster) tend to be
overloaded by printing more than 1000 Characters per second onto
the grafics screen. The FALCON would be the machine to replace
this terminals, if the keyboard wouldn't be build in and there
would be a way for higher resolution grafics (They use 1024x768/72Hz
non interlaced grafics now, so the price is not the problem).

Apple has solved their problems by producing the main software
under their own label (or supporting firms). I don't know, why
the Tramiel family is not willing to do so, but they will not
cure Atari, if they go on as they did. They only way to get out
of the trouble is to make packages for companies as they do in
some way here in Germany.
There are DTP packages with computer, printer, program, service
center and courses. This is not very cheap, but cheap compared
to the PC and MAC alternatives.
This way in other areas would bring them back into the market,
since most people don't want a computer, they want a solution and
the rest is hobbiests and gamers. The PC world has the image of
having the solutions, so they don't need to help the costumer.
-- by the way: I saw more than one unused PC by friends, just because
it was bought thinking it could do some things, which it couldn't.

Sorry for wasting the bandwidth, but here is my conclusion:
I don't think ATARI will make it up, since they want to sell Hardware
only. This business is gone to taiwan and even they don't earn
real money with ist. Since I like the 68xxx architecture for
programming, i will stay with Atari until I can afford a UNIX machine
AND a paper work machine. (OR a affordable UNIX machine with a
WYSIWYG-Textprogramm. UNIX is not a must, but tools and multitasking,
since i like to never leave the editor, while i compile and test things.
(I have at least 3 terminals running most of the time)).

I got this from someone who is unable to post directly to the group:

>This is probably not the reason why your ST is broken, but the same symptoms
>occur if you have the monitor resting on top of the computer. I used to think
>it was the weight of the monitor distorting the disc drive, but the truth is
>that the monitor produces electromagnetic interference which messes up the
>signals on the flatcable to the floppy drive. Some people wrap their flatcables
>in aluminium foil (be careful not to short anything out) but the most effective
>solution is to make sure there is a big enough gap between the computer and the
>monitor.

I forgot about that possibility. Actually it isn't the flat cable picking up
stray signals. It's probably the disk drive is one of those which uses a
hall-effect device and a magnet to identify position. The Monitors CAN
generate enough of a magnetic field to cause the drive to think the speed
is off, so it tries to speed it up or slow it down. This causes data
received to be corrupt as the speed of rotation is NOT constant or even
close to the required speed.

Open the system up and see if there is a magnet or something glued to the
big center wheel. The timing when this gets to the hall effect sensor
is what, on this type of drive, tells the drive mechanism it is at
the right speed.

The other way of fixing the problem is to put a cookie sheet or some steel
beneath the monitor.

I can't post to the net, unfortunately, so feel free to pass this
information on.

--
George Seto (gseto@biome.bio.ns.ca)

Yes, it could also be problems with hall-effect sensors. The flatcable is
the part which is most vulnerable to stray signals though.

What are your specs on your machine? I have a 4mb STe, with an ICD
AdSCSI+ adapter, and TOS 2.06, and nothing I did could get it to run.
I extracted it to a floppy, and booted without the AUTO folder and
accessories (holding CONTROL key), and it didnt work. I turned off the
hard drive, and booted from a single floppy, and still no dice.
Oh, btw: its mono, if that matters...

>that there is nothing to worry about.

I never said that there was nothing to worry about. If I implied that, then I'm sorry because I didn't want to. There's lots of stuff to worry about, but it seems that much of it is out of our control.

What I find amazing is that of the three (?) responses so far that I received about what kind of software people want, two said that they want games. It's interesting because I've had the impression that many people want Atari to shed its game image.

Pattie, yeah, something like Photoshop would be real nice. (I haven't seen ColorStudio.) I think I mentioned INVISION Elite here a couple of days ago. It reminds me of Photoshop, but it's only monochrome. The author says he'll add color support contingent upon the response of the monochrome version. I think it's imperative that he adds color support immediately. There are a few color boards out now and his program looks like it would work wonderfully with them.

Hopefully with ICD's Link, the ST will get some CD-ROM support. (We sure do a lot of hoping around here. :^) I wouldn't necessarily expect many of our own CDs, although there are some out there already, but instead I would expect to see front-end drivers for some of the CDs that are available for PCs and Macs.

STalker 3.02 lets you set the ST's port to 19200, and then of course the modems will negotiate the actual speed between them. On Modem and Serial ports 2 on the MSTE/TT, STalker will let you set some astronomical settings; I can't remember exactly, but one is around 150Kbps, and there are a few others in that realm.

For anyone that's interested MacSEE is now available. MacSEE is a
utility that read and writes files on an Atari ST directly to
a Macintosh disk. It works with both Spectre format 800K disks as well
as 1.44 Meg disks (if you're system supports them) as well as
Mac Hard disk partitions (Spectre and Mac format such as SyQuest
drives). It is based around a GEM interface unlike the previous MacRead
and it supports the MacBinary format in addition to translation.
If you're interested please contact CompuSeller West at (708) 513-5220.
If you reply to this email address after Aug 6 please note that it won't
get answered as I'm moving, and yes I am the author of MacSEE for those
who care to know why I'm posting.

Static variables appear either inside or outside of functions. When they
appear outside functions, they work just as you describe for static functions:
they are private to that source module. (Er, to be picky, they're private
to the current translation unit.)

The original posting seems to describe a genuine compiler bug; it isn't
a matter of usage error in the way the static variables are declared.

Message-ID: <1992Jul31.192247.6254@mnemosyne.cs.du.edu>
Source record: 219004

> how can I order Flash II

The following is from the Flash II press release:

Here's the deal for ordering your copy. We'll accept orders for Flash
II using any of the following methods:

1) For outright purchases (meaning you aren't going to upgrade from
an older version), the price is $49.95 US plus $4 shipping and
handling. You can order via:

a) Telephone: 708-359-9565. If we don't answer, just leave
the following information on the machine and we'll process your
order: VISA or MasterCard number, Expiration Date, Name, Address,
City, State, ZipCode, and phone number. Your charge card will be
billed on the day we ship (which may not be on the day the order is
received, but it *will* be within a day or two! :-). If you want us
to call you back to confirm the order before it is place, please note
that on your message.
b) Mail: Your can, of course, mail order your copy of Flash
II. We'll accept VISA or MasterCard, with the information included
as noted above, or you can send a check or money order (in US funds
please) in with your order. Please do NOT send cash. Although I
don't mind receiving cash in the mail, it's really not a safe thing
to do.
c) Email: Email orders to J.TRAUTSCHOL will be accepted as
if it were a telephone order. Naturally, you must use a charge card
for payment. I'll confirm your order also via Email, and will not
charge to your card until we actually ship.

2) To upgrade from ANY old version of Flash, you must send us your
old Flash disk as proof of ownership. It will be returned to you.
Since we need to see proof of ownership for upgrades, you'll have to
do the mail order thing here. Upgrades are $30 US plus $4 shipping
and handling. You can pay using either check, money order (in US
funds) or VISA and MasterCard. When upgrading, you receive *exactly*
the same package as those who pay the full amount.

For mail orders, our address is:

Missionware Software
354 N. Winston Drive
Palatine, Illinois 60067-4132 USA

Lot of replies already, but here's another...
>
>The price of 14.4 kbps modems have dropped to (relatively) cheap
>levels in the past year, and now the ones I have seen are "only"
>$150 more than the 9600 bps modems. But most of the terminal
>programs that I know of only have a 9600 bps setting, then it
>jumps to the 19.2 kbps setting with nothing in between, namely the
>14.4 kbps setting.

On the ST, the serial port cannot be set to 14.4kbaud, the crystal is the wrong frequency for obtaining this rate. As others have said, the modem will work fine communicating with the ST at 19.2kbaud; it will buffer data internally to make up the difference.
>
>Does anyone know of a program that uses the 14.4 kbps setting?

Just out of curiosity, do *you* know of any other computer system in the world that would talk to *you* at 14.4kbps? I really doubt it... Most Unix systems jump from 9600 to 19200, most terminal multiplexers, etc., etc., also do this. I think if you absolutely had to have exactly that speed, your computer and modem would be very lonely...

>(Don't use baud anymore- with high speed modems, the term becomes
>inaccurate. bps (bits per second) is the preferred convention)
>
From modem to computer, baud and bps are identical. This is also true for modems of 2400 bps speed and slower. But yes, between faster modems, communication occurs at only 2400 baud, with multiple bits encoded per baud, so there a distinction occurs...

Now, THAT isn't a bad idea... One share of Atari's stock is worth $1.50
right now (this is pretty bad so it may not be a safe investment).

We could all get together and just purchase the darn company...

I am also trying to install nn, only on an ATARI ST.

When I run nnadmin with an 'nnadmin I' command to try and initialize the database, I get a 'usr/spool/news/.nn/MASTER not found' message.

Isn't the 'I' command supposed to create this file?

I have created '/usr/spool/news/.nn'.

Otherwise, what programs, files am I supposed to be using/ creating?

Does anyone know how many shares would be required to gain control of the company? How many shares does Jack have?

We'd have to pool all our money and buy it under one firm's title, otherwise no single individual would be able to buy enough shares, unless they were Bill Gates or somebody... Then who would make the decisions? Maybe we could have every contributer's name & draw one out of a hat, and they would control the company for a day... :)

We would never be able to gain control of the company.

The Tramiel family owns 51% betwen them.
Time Warner owns 25%.

This leaves about 20% some that we can actually get our hands on.

That is unless Jack has had enough.

I hate to say it, as I am an Atari Fan, But.....
Doesn't anyone remember the Revolution Handbook? It was an incredable
failure. Until Atari desides to make a diffrence and Users find
something better to do with their computers than Play Games we are
all going to just have to survive.
Like I said, I hate top say it. I do use an Atari Ste for
my business and I wouldn't want to give it up. I guess I am just
tired of Atari not caring enough to do something about it. I also
sell Atari Computers. I find that, in general, It is Old Atari users
buying new equipment. Very few new computer owners for Atari.

And you know why it was an incredible failure? Because Donald Thomas, Jr.
had people writing Oprah, 20/20, and did you remember the Easter Egg
hunt?

Sure, I sent away for the REVOLUTION Handbook AND the stamp, but I only
agreed with about 10% of the ideas of the campaign.

I think he had the right idea, but the wrong way to do it.

Besides, there is nothing wrong with using your computer to play games.
I'm sure that the main use of 50% of the clones out there are to play
games--at least. If your computer isn't the BEST or at least very good
in a certain area, you probably won't use it for that reason.

I'm guessing that Atari is finally doing something about it by
attempting to release the Falcon 030.

And I'm really surprised that there are ANY dealers left.
I'll give B&G that much credit, they can take a whipin' but keep on tickin'.

EGM has reported about hte Jaguar about 2 years ago. They were speculating on its release at that time but it never came. However, there is only one known "Panther" and this is the Intel based 586 (P5) workstation that companies will be able to licence. Take the EGM announcement with extreme caution ;-).

Message-ID: <1992Aug1.191723.18979@u.washington.edu>
Source record: 219027

Guess what I found in my mailbox this morning? Yep! The waiting is over. It looks as if AA will remain in publication. A new firm is taking it over; not Atari Explorer. The Falcon article was excellent! There were pictures... Looks just like a 1040 STe but darker, yellow letters on the keyboard (yuck), and different ports. It'll work with any VGA monitor; no multisync needed! One part said a math coprocessor was included, and another said there is a slot for one... TWO processor direct slots; one for a motorola-based espansion (such as a Mac emulator) and one presumably for an Intel-based expansion, such as a clone emulator. Max number of pixels are 640X400 256 colors out of 32,758, but supposedly the built in overscan will give a 5% larger screen in any resolution... I don't know what that means... scrolling, maybe? This is a dissapointment compared to earlier rumors; I hope later versions will sport 24 bit graphcs! Most of the other rumors appear to be true. Oh, it says 2 megs of RAM are reserved for the OS (MultiTOS), Which is curious, because it will supposedly be available in a 1-meg version... and the internal IDE drive is optional. They did not mention the price, but from what I've heard before, $700 would probably be the 1-meg version with no hard drive. Oh, also there's a new keyboard controller that supports faster typists :) and 300 DPI mice. And a 1.44 floppy with an Ajax chip that is rumored to support 2.88 meg floppies. No external ACSI or floppy drive port. Bi directional parallel port, and the serial port is the 9-pin type (like the TT and Mega STe). It also has LAN port and DSP port and SCSI port & stereo in/out port, headphone jack, internal speaker, etc, etc...

Oh, remember the "THE STORM IS COMING" ad in the last AA? Guess what. There's another ad by the same company in this issue. It says "THE STORM IS BREWING!" with no explanation. But this time it's in the advertisers index. The advertiser is.... "The Storm"! Yippee skip.

Any questions? How many others got their issues today (8-1-92)?

Newsgroup: comp.sys.atari.st
Date: 1992-08-01 19:53:34 UTC
From: herby@danubix.ulm.sub.org
Message-ID: <H.9w3K4u5P9UQ@danubix.ulm.sub.org>
Source record: 219049

In <H.5p5bdeCR8EU@hermes1.uucp>, Mike Stramba writes:
>My question is how do I get my posts to be compressed?
>Is is something I have to setup in the 'mailmode' file?

Mailmode is controlling the behaviour of rsmtp and rmail,
here's a part of my 'mailmode'-File, understandable commented, i hope ;-) :

```
+++++++ fetz +++++++ reissab +++++++ beisskante ++++++ schnippel ++++++
# SMTP sites

linef S F 128
# ^^^^^^^
# Site linef will get smtp-Mail, freezed, packet-Size 128 K before freezing.

novalis S 16 64
# ^^^^^^^
# Site novalis gets smtp-Mail, 16 Bit compressed, packet-size 64 K before
# compressing

# rmail sites
tyrell R
deepth R
# ^
# Normal uncompressed, unbatched Mail

+++++++ fetz +++++++ reissab +++++++ beisskante ++++++ schnippel ++++++
```

rsmtp means 'simple mail transport protocoll'. In your doqueue-batchfile
you have to start rsmtp, rmail, rnews, batch and batchmai in this order:

```
+++++++ fetz +++++++ reissab +++++++ beisskante ++++++ schnippel ++++++
#MAILQ is \usr\spool\mqueue

void ifex $MAILQ/*.X rsmtp
#
void ifex $MAILQ/*.X rmail
#
void ifex $MAILQ/*.X rnews
#
void ifex /usr/spool/uucp/novalis/*.B batch novalis
void ifex /usr/spool/uucp/novalis/*.BM batchmai novalis

void ifex /usr/spool/uucp/linef/*.B batch linef
void ifex /usr/spool/uucp/linef/*.BM batchmai linef
[...]
+++++++ fetz +++++++ reissab +++++++ beisskante ++++++ schnippel ++++++
```

>I'm receiving compressed news and it's gettig automatically decompressed ok,
>so the 'compress program IS in my path.

News are controlled by the 'sys' file in \usr\lib\news, here's a part of
mine:

```
+++++++ fetz +++++++ reissab +++++++ beisskante ++++++ schnippel ++++++#
# '%' means all locally posted articles, '!' excludes newsgroups
#
novalis,aragon.stgt.sub.org,:all,!comp.binaries,!ulm,!local,!junk:16
# ^^^ ^^^^^^^^^^^^^^^^ ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^ ^^^
# site alternate name groups bit compress

linef,linef.ulm.sub.org:ulm,\ # ,\ means newline
!ulm.amiga,!ulm.newuser,\
de.talk.jokes,de.talk.sex,control:f/50
# ^^^^
# freeze, packet-size 50 K before freezing

+++++++ fetz +++++++ reissab +++++++ beisskante ++++++ schnippel ++++++
```

>Not that I'm uploading a lot of news, but every little bit helps save some
>transmission time.

Yes, never waste a penny, better get a beer ;-)

->" >Has anybody had any luck using the Atari mouse under AT-Speed? If so,
->" >how did you get it to work? Does it need a driver? Email responses
->" >are fine, and I will summarize if there is interest. Thanks!

->"Yes, of course you need a MS-compatible mouse-driver e.g. mouse.sys
->"or gmouse.com....

Getting a mouse to work is no problem... getting a mouse _and_ a modem
to work is another deal altogether!

And this is odd because the programmer could have had the Atari mouse
emulate COM2, and the serial port could have been COM1. but when
you choose to use the Atari mouse, the atari serial port becomes
unusable! At least in my experience...

1212. 14,400 bps terminal

Newsgroup: comp.sys.atari.st
Date: 1992-08-01 21:09:31 UTC
From: alex golitsis <alex.golitsis@canrem.com>
Message-ID: <1992Aug1.1113.21693@dosgate>
Source record: 219029

->"The price of 14.4 kbps modems have dropped to (relatively) cheap
->"levels in the past year, and now the ones I have seen are "only"
->"$150 more than the 9600 bps modems. But most of the terminal
->"programs that I know of only have a 9600 bps setting, then it
->"jumps to the 19.2 kbps setting with nothing in between, namely the
->"14.4 kbps setting.

->"Does anyone know of a program that uses the 14.4 kbps setting?

Mark: no need. Most 14.4 kbps modems utilize data compression
to achieve speeds over 50,000 baud (er, bps sorry). So you end
up locking your serial port speed at anything up to 57,600 bps, and
the modems take care of the rest...

BTW, though they pulled out of the Atari market prematurely, I
recommend the SupraFAXModem v.32bis. Gorgeous modem, good price
(Rockwell chipset), and it will be with you for some time.

Aren't these new modems awesome? Finally the _modem_ is faster
than most computers are capable of handling!

1213. Re: 14,400 bps terminal program

Newsgroup: comp.sys.atari.st
Date: 1992-08-01 21:32:24 UTC
From: jan@janhh.hanse.de
Message-ID: <4070.08.92@janhh.hanse.de>
Source record: 219056

In my view the point isn't so much the speed of transmission, but the speed of display. I've been very happy with Uniterm, but since I have a modem with 14400bps I notice that the display is still running while the recieve LED is already out. Obviously Uniterm can't keep up with the modem...

Other programms (Rufus, CoNect) seem to be even slower.

Did anybody actually measure the speed at with any specific terminal programm can display it's input ? Anything better than Uniterm out there ?

> well.

(1) Atari didn't write GEMDOS -- Digital Research did.

(2) There's an alternative -- use MiNT. MiNT allows you to add new file
systems. This is even easier than trying to replace the Fopen, Fcreate,
etc. calls, since MiNT's code for Fopen etc. will do the parsing of
file names, determination of which file system driver to call, and
file ownership/permission checking for you automatically. And yes,
MiNT replaces everything, including Pexec.

It is highly likely that MultiTOS will have the same features (I can't
say "for sure", since I'm not an Atari spokesperson; but it stands to
reason that if MiNT has loadable file systems, MultiTOS will too!)

FALCON'030 REVEALED! -- The next generation of home computer is
"""""""""""""""""""" on the way and the Falcon'030 leads the
pack with power and features.
FALCON'030 at a GLANCE:
* Motorola 68030 Microprocessor running at 16MHz,
multi-tasking capable
* Motorola 68881 or 68882 16MHz Floating point coprocessor
* Motorola DSP 56001 Digital Signal Processor (DSP)
* 1 to 16MB of memory and 512KB of ROM
* 16 bit BLiTTER Graphics coprocessor running at 16 MHz
* Enhanced Broadcast TV quality Video
-- "True Color" 320x200 resolution, 32,768 colors or 640x480
resolution, 256 colors from a 264,144 color palette
-- VGA or Video 320 or 640 by 200 or 400 resolution, 2, 16, or
256 colors from a 262,144 color palette
-- Standard STe video modes with a 4096 color palette
-- RF modulator and VGA monitor connections
-- Overscan support
-- Genlock and multi-media capable
-- Graphics overlay and video tiling
-- Enhanced high speed 16MHz Blitter graphics co-processor
-- STe horizontal scrolling
* "CD quality" stereo sound
-- Stereo 16 bit Analog to Digital inputs
-- Stereo 16 bit Digital to Analog outputs
-- Eight channel stereo DMA sound engine with 16 bit PCM digital
record/playback with up to 50KHz sample rates
-- Stereo 8 bit STe compatible PCM sound
-- ST compatible 3 channel PSG sound
-- Multiplexer to connect Codec, DSP and DMA sound engine
-- Stereo microphone inputs and headphone outputs connected to a
16 bit stereo codec
-- DSP digital audio connector, up to 1MHz data transfer rate
-- Built-in monophonic speaker
* 1.44MB floppy drive
* Built-in IDE 2 1/2" hard drive interface (drive optional)
* SCSI II peripheral interface (hard drive, tape drive, etc.)
* Mega STe/TT compatible local area network (LAN) interface
* Enhanced modem/RS232 port
```

* ST and STe compatible joystick/controller ports
* Built-in "processor direct" expansion connectors
* On board real time clock and battery backed up RAM
* MIDI input and output
* Parallel printer port
* Enhanced keyboard controller allows 300 DPI mice

. . . . . .

A closing note from Darren Meer:

There is one area of transition that I need to tell you about --
that being the world of magazines. This issue is not only historical
in its content, it also marks the last issue of "Atari Advantage"
Mike and I will be involved in. We have been asked to join the "Atari
Explorer" staff and bring our style of coverage and production
values. "Atari Advantage" will be left in the hands of a very capable
and extremely energetic group of writers and users who will introduce
themselves in next month's issue. We are really excited about the
opportunity to join "Explorer", and feel confident that the Atari
market will be well served by both magazines for a long time to come.

If any of you have any concerns as to how this affects your
subscriptions, articles or advertisements, please don't hesitate to
call or write us to express your feelings. We want you to get your
money's worth and will do what ever we can to make sure your do.

And finally, we want to thank all of you who have waited so patiently for this issue to arrive. Between the Falcon coverage and negotiations with Atari, our schedule got completely thrown out of whack. Those things along with the intense Murphy field that has been hovering over our offices, combined to make this an especially memorable issue for us as well (he said with a big twisted smile).

. . . RjR 8/92

1217. The CodeHeadQuarters BBS - What is the number?

Newsgroup: comp.sys.atari.st
Date: 1992-08-02 03:25:37 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <eP1uoB1w164w@ersys.edmonton.ab.ca>
Source record: 219034

Could someone tell me the number of the CodeHeadQuarters BBS? I remember reading something about it somewhere, but I never found the telephone number. Now that I have a 14,400 Baud modem I would like to do some long distance calling.

Also, what are the requirements concerning upload/download rations, validation, etc?

Any information would be appreciated.

1218. What's the best vi editor for the ST?

Newsgroup: comp.sys.atari.st
Date: 1992-08-02 05:08:59 UTC
From: dave@admiral.uucp
Message-ID: <1992Aug02.050859.12372@admiral.uucp>
Source record: 219045

I have recently taken a liking to the vi editor (nobody really *loves* vi, do they?) and would like to get something similar for my ST. There are three or four vi clones on atari.archive, and I'm just curious what people think. The only one I've heard mentioned is Elvis, and I can't remember what was said about it.

Please post or mail comments, whichever you prefer.

> to split across disks (I just don't let it split them for now).
>
Well I've got The Vault (& The Key) and used it for some time before I gave
up with it. The problem I found is that since I'm running TOS 1.0 which does
its archive bit the wrong way round I couldn't use the incremental backup
in The Vault. Worse than that, since I'm using Neodesk which sets the
archive bit the same way as TOS 1.4 I get some archive bits set one way and
some the other (depending upon whether I'm in Neodesk or a CLI !!!)

I now use a backup program simply called 'Backup ST' - it keeps a complete
copy of your hard disk on floppies (so if you delete a file on the hard disk,
it will be deleted from the backup files) - in some respects I find this
preferable to doing the normal incremental backups where you end up with a
pile of floppies which is > the current contents of the hard disk. The only
gripe I have with the program is that the error handling isn't very good so
if I get a floppy disk write error I basically have to re-start the backup
again.

The Revolution Handbook failed because it was a very poorly executed idea.
The overall idea wasn't a bad one, it's just the ideas presented within it were
lame. One of them was to have a letter writing campaign to the (at the time)
most popular show on TV, Roseanne, and have them write an episode in which the
family buys an Atari computer, but has trouble with it, and calls in the local
Atari user-group for help. First of all, even if this episode did get written,
do you think that ABC would air such a blatant plug for Atari without getting
some sort of recompense from Atari itself?

The entire handbook was full of silly ideas such as the one above. Maybe if
someone who had a clue wrote that book, the Revolution would have been a bit
more sucessful.

From: azog@world.std.com
Message-ID: <BsDH8q.Gx5@world.std.com>
Source record: 219038

I posted this on my other machine, but it didnt seem to get out...

I ftp'ed gcc the other day, an older version (1.40?), and need to
get some info on getting it too work.

Firstly, I also got the MiNT libraries (mntinc20, mntlib20, and
mntolb20), which state that they can fully replace the GCC libraries.

Now, I have all the gcc stuff located in \bin, the headers in \include
the libraries in \lib, and the olb stuff in (guess?) \olb.

What do I need to set so that gcc will search the correct places for
all this stuff? I have set all the above in my path (with ksh04a),
but something like:

$ gcc hello.c

doesnt do anything.

Thanx

1230. MiNT 0.95 now available

Newsgroup: comp.sys.atari.st
Date: 1992-08-02 23:15:39 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1992Aug2.191539.1@uwovax.uwo.ca>
Source record: 219041
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

MiNT 0.95 is now available for anonymous FTP from atari.archive.umich.edu.
The files are:

mint095b.zoo -- executables for MiNT
mint095s.zoo -- MiNT source code
mntman95.zoo -- MiNT programmer's manual (nroff man pages)
mntutl95.zoo -- various utilities for use with MiNT; these haven't
changed much since 0.93.

Along with the MiNT executables is provided a beta version of TOSWIN,
a really nifty (well, I think so :-)) new window manager that can work
as a .ACC. Unlike the old BGACC, this one supports arbitrary GDOS fonts
(including proportional fonts!), scrollback (like xterm), and allows
for dynamic resizing of windows.

Please read the "readme.1st" file that comes with MiNT. The MiNT installation
procedure has changed somewhat with every version. The basic idea is still
the same (put mint.prg in your AUTO folder), but there are now more options:
for example, mint.prg no longer has to be the last thing in the AUTO folder,
and if you hold down the right shift key while booting MiNT will ask you
if you want to start it.

There are also lots of new features in 0.95, including better terminal
support and a shared memory file system. See the "readme.new" file that
comes with MiNT for more details.

From: avp@garfield.cs.mun.ca
Message-ID: <1992Aug3.005053.23508@cs.mun.ca>
Source record: 219044

ny one use STraight Fax?

I have been using it for a little while, it its an OK prg, but
I have my modem on serial port 2 (device 7) on my mega ste.

Straight FAX will let me select and use this port, but it
won't save the information. i.e. I run STraight FAX, it says modem
not responding, I select serial port 2, it says OK, modem now
responds, I select save preferences, then I quit. I run the prg
again, it says modem not responding. I bring up the menu, and it
says serial port 1 (device 6) selected.

This is VERY annoying. Does anyone know of a byte in the
inf file that controls this selection or any way to fix this?

(Incidently, my supra v.32bis fax modem is on port 2 coz I get
errors all over the place in port 1, yes, I have the serial patch
in my auto folder)

Thanks in advance,

Unfortunately, it is most certainly not that simple. I do not put the
monitor on or even all that near the machine. The reason i do not put it on top
is because it quite simply will not fit. The reason i do not put it directly
behind is because then i cannot see it too well, as the computer and a bunch
of cables are in the way of my view.
I have always put it on a shelf, about a foot above the computer. Ther
RF distortion field is not that big. Besides, I did say i tried it with another
drive.
No offense but, survey says... *ahnnnnh!*

gwmeyer@iastate.edu (Gordie Meyer) writes:
>Actually, I think ICD just announced such a device, called The LINK (tm).
>More details on it are available in the online magazines.

I think Daniel meant ACSI to SCSI adapter. The LINK is a glorified
SCSI to ACSI separate-host-adapter-in-a-box that seems to do
everything but take out the garbage. :) It will be nice to see CD
roms and other alternative media available via this device and ICD (or
other?) software.

Why anyone would want to go SCSI to ACSI via a host adapter then
ACSI to SCSI again just to connect to their falcon is beyond me. Just
rip out and sell the host adapter.
Re: Atari lasers...connected to SCSI? That's beyond me. Probably
not worth it, IMHO. Buy a new one.

Nice to see that Atari isn't limiting themselves with ACSI in the
future...(fingers crossed, knock on wood)...

>I've tried vi, stevie, and elvis from a.a; my vote goes for elvis. I found
>the other two to be buggy.

I agree because it is closest to the original. The others offer only a small
subset or try to improve on vi. No matter how sensible these improvements
are, they make it very annoying to use the editor. However, Elvis is
not exactly perfect. Most annoying are:
- Its complaining about lines that are too long. I don't know why but
for many files it thinks that there are lines in it that are too long
(there aren't; in fact, often these files have been written in a previous
session with Elvis!), and it then (sometimes!!) inserts newlines at
a random position in a line.
- Its enormous hunger for temporary disk space. Just like the real vi,
it wants to write a temporary file to record changes in the file
that is edited, and allow the user to recover after a crash. However,
this requires very large temporary files, often larger than the file
that is being edited. Ofcourse you can use a ramdisk, but for files
of any size you will need a very large ramdisk. I would like
to switch this off.

You have been warned..

>>
>From modem to computer, baud and bps are identical. This is also true for
>modems of 2400 bps speed and slower. But yes, between faster modems,
>communication occurs at only 2400 baud, with multiple bits encoded per
>baud, so there a distinction occurs...

Actually most 2400 bps modems use CCITT standard V.22bis (or a Bell variant) which are actually 600 baud. V.22bis uses a 16 state QAMPSK constellation. Many of the 1200 bps modems use V.22, which is 600 baud QPSK.

For those who don't know what we're talking about, the term "baud" really means "symbols per second", whereas most people use it to mean "bits per second", which is denoted by bps. High speed modems generally only send 2400 symbols per second (baud), but each symbol represents 4 or more bits (4 bits * 2400 baud = 9600 bps). Some of the extra bits in the symbols of the very high speed modems (V.32bis, for example) aren't even used to carry information, but rather for error correction techniques (in this case trellis coded modulation). This is further complicated by using data compression schemes to increase the information throughput.

Most of this is too complicated for the layman to understand, so I'm afraid that the word "baud" has lost it's original meaning just as the words "unique" ("This song is very unique"), "critical" ("It is extremely critical to have this finished by Wednesday") and "literally" ("It was literally 1000 degrees in my apartment") have. Such is the evolution of the language.

Source record: 219061

I tried to run the following program. It compiles without problems but when I try to run it, it writes the numbers from 1 to 25 (the height of my screen). Then it scrolls the screen up one line and aborts with a Bus Error (two bombs).

```
#include <curses.h>

main() {
WINDOW *stdscr;
int i;

stdscr = initscr();
idlok(stdscr, TRUE);
scrollok(stdscr, TRUE);
for (i=1; i<30; ++i) {
printw("%i\n", i);
refresh();
}
endwin();
}
```

What did I do wrong? I'm using a Atari ST and GCC-2.1. The termcap entry I use is

```

Don't buy the turbo25 board. it's tends to crash, if you use it.
The 030 cards are quite better, but way more expensive of course.

I purchased a 16 MHz 020 kit for about 400 bucks. It works quite nice.

Anyway there was a big article about accelerators for ST's early this
year in the german 'ST Computer' magazine. I can't recall any lines of
it, but maybe someone can help out ...

1245. GCC 2.1 FAILED TESTS!!!

Newsgroup: comp.sys.atari.st
Date: 1992-08-03 18:34:16 UTC
From: dah90@ecs.soton.ac.uk
Message-ID: <12420@ecs.soton.ac.uk>
Source record: 219076

Right! I trashed GCC1.40 and installed 2.1 (including the new libolb80 containing ctr0 and gctr0). Everything is okay... wait for it... EXCEPT for 4 of the gcc tests (the g++ tests work okay). Here they are...

tbcopy -- crashes, bombs
trdwr -- finds "Hello, world" instead of "Hewwo, world" (appends instead of doing random access, I think)
tstdio -- "Write and Read Update Test
1535 ok
511 failed -1 expect 255 got -1

Write, Read, Write and Read Update Test
1535 ok
511 failed -1 expect 255 got -1
1535 ok"
tstrl2 -- Test22("0xGZZZZZ") failed
Expecting: 0 0 de491
Got: 0 0 de492

Has somebody else tried these tests? Is it just me? I hope someone else has cause these (epesh the random access bug - I have tried everyhting to get round it - in trdwr could be quite serious).

Thanks.

Bye now, Dave

From: dah90@ecs.soton.ac.uk
Message-ID: <12422@ecs.soton.ac.uk>
Source record: 219077

I have Less 1.77 and Make 3.62. Both from a.a and both bugged (did post a while back, reposnse was to the effect "Yup, they're bugged but I've got a good version...").

I got the sources and tried to recompile them but just couldn't get them to go (linstall and bash 1.12 didn't like each other for Less and Make 3.62 wouldn't get past job.c). Also, I am in the middle of switching to 2.1 (see my other post??) and have some troubles so I don't trust it.

Can any kind soul either mail me a copy of their compiled binaries (Less, Lesskey and Make362) or post new versions to a.a. This would be greatly appreciated since these are (apart from Gcc and Latex) my most used utilities - hell, programs!

Thanks (in advance) Dave.

1248. MINT / GEM setup question

Newsgroup: comp.sys.atari.st
Date: 1992-08-03 19:46:06 UTC
From: dah90@ecs.soton.ac.uk
Message-ID: <12424@ecs.soton.ac.uk>
Source record: 219079

With Mint 0.95 just posted, I've decided to take the plunge. Currently I am running Tos 1.62 with Neodesk on top and shelling out from Neodesk using an icon for Bash 1.12 (TOS port by some good person). This is okay and works fine.

Now I have/will download(ed) Mint, what are the options for my setup? Could I go straight into Mint from the Auto folder, or run it as a startgem, or just jun by clocking from Neodesk?

What are the pros 'n cons of the approaches? I've heard about "init" which (I think) inititialises GEM and BGACC (now TOSWIN) - presumably I will not be able to use these if I run Mint after Neodesk? (or can TOSWIN still load as an accessory ready for when Mint runs).

How much TOS stuff is compatible with Mint (I use mostly Unix ports)? If init is used, does GEM stuff run fine - how is the GEM runner program.

I realise that there may be a bit much here. Please don't tell me to d/load it and try it all out 'cause I just wanna install it and go (!).
Hey, perhaps just mail me and tell me how you use/integrate Mint with GEM???

Thanks a lot (especially to Eric Smith who seems to put a lot of work in, and to all those who keep the ST PD scene alive - if it weren't for you, I would have got rid of my ST about a year ago),

Dave.

I think serious direct-to-disk hardware/software is already available.

For the Video Toaster-like stuff, expect Lexicor to have some stuff out.
Right now, they have STs connected to Silicon Graphics machines. They're
porting their software to the SGI platform. Lexicor is also giving their
programs Spectrum 512 support for those that may not be able to afford
graphics cards, but still want a good number of colors.

>all get the same info. I believe (not sure about this one) that each SCSI-2
>device can become bus master, so DMA between SCSI-2 devices is possible.
>SCSI-2 uses the same cabling as SCSI-1.

Are you sure about the multiple-target feature? As I read the spec, you still
have the same 8-bit target identifier, and it still reads that it is only
legal for 2 bits at most to be set - source ID and target ID. It would
definitely be great if the multiple-target feature were there, but I don't
think so.

Also, any device could be bus master in SCSI-1 as well. (cf: the copy command
supported by some disk and tape units...) Notable in SCSI-2 - devices can
negotiate high-speed synchronous data transfers, (up to the speeds quoted
above), as well as wider data paths (up to 32 bit width, requires a second
cable). The 16 bit bus is merely one of these options, it still defaults to
8 bit.

Read comp.periphs.scsi for more info; there's also a standards BBS that you can
call up to get the full text of each specification.

I agreed. Elvis.

>Elvis is
>not exactly perfect. Most annoying are:
>- Its complaining about lines that are too long. I don't know why but

I've worked out why this happens (finally!). Someone with the source handy
might like to change it - the bug is that when Elvis on the ST loads
documents, it fiddles with the CR/LF pair, converting it to a LF. HOWEVER,
some counter of line length doesn't get told: because you'll find documents
of any size load fine, provided you strip the CR's from them first (which
is very annoying). This only happens with files >32K (it appears), and anyone
writing source files that big should be shot ;-).

>- Its enormous hunger for temporary disk space. Just like the real vi,
> it wants to write a temporary file to record changes in the file
> that is edited, and allow the user to recover after a crash.

I call this a feature. When a shell escape crashes you machine, you will too.
(provided you use a recoverable ramdisk - harddisk /tmp is too slow).

1256. Need manual for Publishing Partner (ATARI ST)

Newsgroup: comp.sys.atari.st
Date: 1992-08-04 03:10:18 UTC
From: ccat@netcom.com
Message-ID: <7-vmm0p.ccat@netcom.com>
Source record: 219072
Cross-posted to: comp.sys.atari.st,misc.wanted

Ihave an old single sided disk Atari 520ST and it
came with some old software.. One of the programs is
"Publishing Partner" by Soft Logik. I have called them and they claim
not to have anything approaching a manual for this (very old)
program. I have it up and running on my dot matrix printer,
but I don't have any documentation or any fonts..except
Helvetica and System... I know this technology and software are
totally obsolete,but it's all I have got or can afford
right now..since I'm on a very tight budget. I'm not trying
to pirate this software, I have the original disk (but not the manual..)
Does anyone have the manual for this or know of another program that
woyuld run on a SS drive (no HD)...
Thanks!
Chris.

Has anyone heard much about the 64-bit game machine from ATARI?
I've heard that it would be sold for under $200.00!
That's why I've put off buying a Genesis (noticed price drops!).
Atari DID scrap their 32-bit game machine because it was AHEAD of
schedule... and decided to concentrate on the 64-bit'r...

So anyone heard any peeps?

Sorry, but that's not true. I have seen this happen with files that are much
shorter than 32K. And you don't mean it about getting shot for such large
source files, I think that if you did you'd have to shoot the author of
Elvis too. Whatever the shortcomings of Elvis are, he (she?) doesn't deserve
that :-).

>>- Its enormous hunger for temporary disk space. Just like the real vi,

I know it is intended as a feature, but I still find more annoying than
useful. In the rare case that I would want to do a shell escape from Elvis
I would save the file first anyway. At least one should be able to
switch it off..

> for dynamic resizing of windows.

Yes, I agree, TOSWIN is really neat stuff. But there's still one nasty
incompatibility with NVDI (2.0.3), the same as in BGACC: If you have NVDI
installed, you have to set "alias precmd 'echotc vi' and sacrifice
your cursor, because otherwise every second or third keypress only
produces a black cursor box in the command line, covering the letters.
Thus, command line editing in tcsh is no more fun, editing in vi or
emacs, too.

I don't want to miss NVDI - screen output performance would be lousy
without. Any suggestions what to do?

Regards,
Markus.

Hi,

mike@r-node.gts.org (Mike Stramba) writes:

>I am also trying to install nn, only on an ATARI ST.

>When I run nnadmin with an 'nnadmin I' command to try and initialize the
>database, I get a 'usr/spool/news/.nn/MASTER not found' message.

>Isn't the 'I' command supposed to create this file?

>I have created '/usr/spool/news/.nn'.

>Otherwise, what programs, files am I supposed to be using/ creating?

the problem of the NN port to the Atari ST is, that you have to build an
"active" file (NN format, not HERMES-like !!) in /usr/lib/news before
running nnadmin -I.

You can build this file by using the included "buildact.tos".
Buildact.tos searches for "/usr/lib/hermes/active". It's output is a
UNIX compatible "active" in "/usr/lib/news/active".

With an adequate active file, GROUP and MASTER are built correctly.
For securety reasons here is my configuration of the neccessary NN
variables.

nnadmin -C >g:\conf:

```
---------------------------- cut here --------------------------------
Configuration:

BIN: not used
LIB: g:\usr\lib\nn
NEWS SPOOL: g:\usr\spool\news
NEWS LIB: g:\usr\lib\news
DB: g:\usr\spool\news\.nn
DATA: g:\usr\spool\news\.nn\DATA\{group-number}.[dx]
ACTIVE: g:\usr\lib\news\active
Database format is machine dependent (byte order and alignment)
Database version: 0
Recording usage statistics
Mail delivery program: recmail
Query for appending .signature DISABLED
Max pathname length is 255 bytes

Environment:
```

```
NEWS=g:\usr\spool\news
NNDBDIR=g:\usr\spool\news\.nn
NNLIBDIR=g:\usr\lib\nn
NNHELP=g:\usr\lib\nn\help
NNLOG=g:\usr\adm\nn.log
NEWSLIB=g:\usr\lib\news

--------------------------------- cut here --------------------------------

Hope this helps,

Thomas

It won't be out until the second half of 1993. This means maybe
around October, 1993 or so.

I heard it will cost more than $200. Maybe $300 or higher.

It will compete directly with the NEO*Geo.

So, if you want a Genesis, buy one when the price is lowered to $99.95.

1268. Hardware and Software for Sale

Newsgroup: comp.sys.atari.st
Date: 1992-08-04 13:30:29 UTC
From: aw@caesun6.harris-atd.com
Message-ID: <1992Aug4.133029.5648@trantor.harris-atd.com>
Source record: 219086

If the price is not right, let me know -
everything must go by September. Will provide
complete library of magazines and disks FREE with
any substancial purchase:

HARDWARE:

I.B. 5 1/4 drive $ 55
atari 3 1/2 drive $ 65
1040st tos 1.0 $145
1040st tos 1.4 2.5Meg with $445
45 Meg Supra Hard Drive
old style color monitor $145
new style color monbitor $125
mono monitor $ 70
multisync connector $ 35
disk to disk copy cable
2 monitor connector
gemini 10x printer
joysticks
NAVARONE TIME KEEPER
holders for disks
oak stand for monitor
power strip

Only known concerns - (1) hard drive has occasionally "stuck"
upon power on. If toggle off and on a couple of time
it is ok. Twice a next day same problem, other times
2 months no problem (last year and 1/2 of activity). It is a self
parking disk and has not had any sectors go bad.

(2) Period button on 1M 1040st number pad
is down (does not work). Remainder of keyboard fine.

Super Pricing:

everything *** $ 799 ***

1040st & Color Monitor $ 220
1040st 2.5M, HD & Color Monitor $ 499

PRODUCTIVITY SOFTWARE:
PC Ditto, Interlink ST, FLASH, LDW Power Spreadsheet
VIP PROFESSIONAL, Word Perfect 4.2, DAC EASY
Timeworks - Word Writer ST, Partner ST, DataManager ST
EASY DRAW W/Super Charger, CAD 3D 2.0, HiSoft Basic Professional
GFA BASIC, Athena II, Personal Pascal, TRIMbase, VALUE TIME

PRINT MASTER, ST Ledger, DEGAS ELITE

SOFTWARE GAMES:

greg norman's ultimate golf, world class leader board,
High Roller (Harrier Simulator), silent service,
after burner, star glider, autoduel, rogue, hardball,
flight simulator II, hippo computer almanac, leader board,
carrier commander, hacker, 10th frame, joust, world games

SOFTWARE EDUCATIONAL:

I'm sending Frank Ridderbusch's new version of GNU make 3.62 to
atari.archive today (watch for the announcement on
comp.sys.atari.st.tech).

Sorry it took so long, Frank, but I went on a short but long-planned vacation
just as it arrived. (Bad timing on my part.)

1271. LDW Power upgrades

Newsgroup: comp.sys.atari.st
Date: 1992-08-04 14:36:46 UTC
From: hartlenk@newton.ccs.tuns.ca
Message-ID: <1992Aug4.143646.29693@newton.ccs.tuns.ca>
Source record: 219089

Anyone know what is going on with LDW and Atari? In the June '92 issue of AtariUser they mentioned in the News pages that Atari Corp. acquired the LDW Power spreadsheet package.

Back in March I bought an unused copy of LDW Power v1.03 and when I called to see if their upgrade offer was still good, I got a 'number has been diconnected' recording. I guess LDW no longer exists. Anyone hear anything on Atari's plans for LDW upgrades or has it been given the kiss of dead like Neocept's Wordup!

1275. 1040 st for sale

Newsgroup: comp.sys.atari.st
Date: 1992-08-04 16:30:44 UTC
From: coffin@mars.ced.utah.edu
Message-ID: <1992Aug4.163044.17573@fcom.cc.utah.edu>
Source record: 219092

Hello ST folks,
I reciently aquired a 1040 st with color monitor and a single
3.5" disk drive. I also got a couple of boxes of software with it. The
question is what is it worth? You see, I don't want it. I got in lou
of a debt and I want to get rid of it before I get emotionaly involved
with it. So, I was hoping some of you folks out there that are
emotional about these machines could tell me how much I should sell it
for. I would prefer to dump it as a whole package, but I'll be willing
to split up the software and the hardware.

Thanks,
Steve Coffin

From: ultron@csd4.csd.uwm.edu
Message-ID: <1992Aug4.175902.7607@uwm.edu>
Source record: 219093

Is there a good PD vt100 program for the Mac that runs on Spectre? I am currently using Zterm (some old version) that doesn't support Unix at all. First, there is no [ESC] key defined on the Spectre (is there?) so I can't use vi. Second, there is no [Cntl] key defined either, so forget about putting processes in the background. Is there a way to map these keys from the ST to be recognized in vt100 mode when emulating the Mac via Spectre (whew!)?

Sure. That one is easy. Outbound has a special agreement with
Apple. You want to know why? Because they are (at least in part) owned
by Apple.

OK, to telnet to DELPHI, simply use:

telnet delphi.com

or if you prefers numerics:

telnet 192.80.63.1

You will of course need an active id (although there may be a
'signup id' you can use to request a Delphi account, but I am not sure
what it is).

Anyways, just giving you the lowdown on the telnet addresses, as
requested.

I would like to sell a Mega STe I've got here. It's just over
1 years old, used fairly extensively but in good condition.

Mega STe
1 meg RAM
TOS 2.05
3.5" Double Sided Double Density Drive
Comes with miscellaneous PD software

Single Sided, Single Density Disk Drive (External)

Monochrome Monitor (SM124)

ASKING PRICE: $650 OBO for all of the above

Buyer pays S/H.

I'm selling it for a friend who's moved to Japan.
If interested, reply ASAP.

In August, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a very informal meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.

We will also give attendees the August issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, August 12, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

1293. BoozGEM 2.1.3 and WX_Lib 1.0

Newsgroup: comp.sys.atari.st
Date: 1992-08-04 22:30:17 UTC
From: MDORMAN1@ua1vm.ua.edu
Message-ID: <16839F629.MDORMAN1@ua1vm.ua.edu>
Source record: 218862
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

New postings to atari.archive:

BoozGEM 2.1.3 (file: boozgem3.zoo):
This is my port of Booz (the unZoo utility) to the Atari ST. It includes an integral GEM interface with menus and the whole lot. It also lets you extract a .ZOO file to a specific directory that you request (Happy, Roger?). You can also use the ``Install Application'' feature of the desktop, so that when you double click on a .ZOO file, it will automagically extract into the current directory. You can also do a ``Batch Extract'', which will take all of the .ZOO files in the directory you select, and extract them into subdirs inside the destination directory you choose. There's lots more (including the standard, CLI-based BOOZ.TTP), that's why I wrote a doc file for it.

The one problem: It doesn't support subdirectories inside of .ZOO files. The capability was unfortunately lacking in the original BOOZ sources. I'm slowly attempting to hack the appropriate routines out of the original zoo 2.1 source, but if anyone more conversant with the zoo 2.1 sources would like to volunteer to help, I would be most pleased.

Also newly uploaded is WX_Lib 1.0. This is a library of extended window management routines that allow you to open, close, move, size, clear and otherwise do efficient manipulation of GEM windows, as well as providing character-oriented output functions, including puts() and printf() clones that support automatic scrolling within the windows. An older, slower version was used to do the windowing support in BoozGEM. It includes support for HSC 1.33i/1.40 and GCC 2.1, object libraries for HSC & GCC, source code that compiles with GCC's "extra whiny" mode (-Wall) just fine, an example program, some docs, and the binary to the example program--one from HSC, one from GCC. Oh, it's only tested in GCC's 32-bit int mode--I have no idea what __mshort__ would do to it.

Download and enjoy, and please report any bugs or suggestions to me at mdorman1@ua1vm.ua.edu, or, preferably, mad@sss.cba.ua.edu.

Mike.

Hi, EdHak from Clear Thinking has this feature. It allows you to load in certain parts of files into the buffer and mess around with them. You might also want to try Sudden View and Steno, these are new editors and may also have the feature (although I do not know at the moment).

If anyone wants addresses or phone numbers, I can provide them.

>Jim Allen would love to see this. His customers on GEnie seem quite pleased
>with all of his products, especially the T-25.
Hmm, maybe. I refer to an article in a germany atari magazine early
this year. I can get hold of that article, if someone requests it ...

This may get back to the fact the the 68000 has never been rated over 16MHz.
Although Allen can certify (test) the T-25, I would expect some folks have
heat problems when the T-25 is in a room with no A/C on a 90 degree day.

>may also have the feature (although I do not know at the moment).

If I understand the question correctly, what's wanted is an editor
that can edit files larger than the computer's memory size? For
instance, editing a 3MB file, on a 1040 ST, with just 1MB of RAM...

Neither Sudden View nor STeno can do this. I use Sudden View as my
primary editor (great fun!), and there are options as to what quantity
of memory is used (you can configure the desk accessory to accept
varying sizes of files - I like 200K as a nice, round number).

STeno also specifies a fixed amount of memory on bootup (if it's being
run as an accessory) which is also clearly limited to total RAM (less
some overhead).

Edhak DOES appear to be what you are after.

1297. Getting Elvis to work with TOSWIN

Newsgroup: comp.sys.atari.st
Date: 1992-08-05 02:29:42 UTC
From: azog@world.std.com
Message-ID: <BsHo9J.Hvy@world.std.com>
Source record: 218866

I hope Eric doesnt mind me posting this, but I thought it valuable
enough to share.

I use Elvis (vi clone) quite often, and when I got MiNT 0.95, I thought
it would be wonderful to have Elvis sitting in a TOSWIN process. For
a day, I couldnt figure it out, but every time I started Elvis from
TOSWIN, I got that Cannot determine TERM type or whatever. I had TERM
and TERMCAP variables set everywhere I could, and still it wouldnt work...

Then I noticed when I started bash, that TERM was tw52, and TERMCAP was
tw52, also. I just used xxed to edit TOSWIN.ACC, and searched for all
occurances of the string 52, and changed tw52 to vt52 (three of them,
and one is TERM=st52)

And it works. Pretty cool. TOSWIN is the best part of MiNT! Wonderful
peice of programming

Source record: 218876

1. Yes there IS an ESCape key with Spectre GCR (v.30) it details in
the manual how to obtain it.

2. If running UNIX is giving you problems - try using the machine for
what it was designed for, that way, a LOT more software will work
correctly, and your keyboard won't wear out as fast!

DELPHI is in fact a pay service so you would need an account with them. I do read this newsgroup regularly and if I don't see anyone else post at least even a synopsis of the discussion, I will get it from ST Reports and post it here with their permission.

You can access DELPHI via Telnet, with DELPHI.COM as the address. DELPHI is a pay
service, so an account is necessary. You can get details on getting an account if you send e-mail to biblinski@delphi.com.

You can also get the transcript e-mailed to you by sending a request to the same address.

Yes it was a german magazine which wanted to test the card cause of
the 'overdriving' (from 16 to 25 Mhz):
The machine crashed indeed! but after 2 days of mail server work.
I personnally never worked on my ST 2 days long without having a break
(just to please my belly). So unless you use it as a server, no problems
with the T-25.

And for the original question: I think upgrading over the T-25 (I mean
with a 020 or 030) is out of question: not much more powerful (cause of the 16bit 8Mhz RAM
bottleneck) or too expensive compared with a TT (which comes
with SCSI, VME, better video, better TOS, 1.44M disks and some more goodies).
And I don't even mention compatibility problems !

Delphi is indeed a pay service... even with telnet access, you'll need a Delphi account to attend the Tramiel conference.

Delphi can also be reached by Telenet or Tymnet.

I don't have all the details on pricing and access, but every issue of ST Report has everything you need to know to join.

However... I'm certain that a transcript of the conference will be included in a future issue of ST Report, so unless you want to actually be there and possibly ask Sam Tramiel questions directly, all you'll need to do is pick up a copy of STR...

>HD! I'm sure you all know how that goes...

>I got GDOS with STalker.

I have had similar problems with some older GDOS drivers, although in
my case the problem could be with a printer driver, I can't remember.
I have not had problems with the GDOS drivers that come with the new
FONTGDOS.

Although Atari does not charge money for it, it is not public domain, so
you will have to get it from Atari. Here in Holland I got it from the BBS
of Atari Benelux. For the USA I don't know.

The new GDOS is much better than the older ones released by Atari, but it is
not perfect: it is somewhat slow and has at least one (minor) bug.
Fortunately, the GDOS drivers that come with it also work with older versions,
including NVDI GDOS.

The 1029 was released in Europe. If I'm not mistaken, it was the best selling
printer of the XL line. Could do graphics too (try that with a 1025).

I have run Ravel on the PC a fair bit and have an ATARI user friend more than somewhat anxious to use it on the Atari.

The specification for RAVEL says that it has been ported to an Atari, and there are lots of "ATARI-only" commands in the manual.

Do any of you Atari-newsgroupers know where I can get it?

[RAVEL is a c-like language with compilers and linkers within which to programme music. It is wonderful].

Thanks in anticipation.

What is this? Do you mean to say that I need other Mac Roms than the ones I have to be able to run system 7? Should it not be a SPECTRE software update taking care of that. I mean my good old Mac Plus runs just fine with system 7. Or did I just get your question all wrong?

I've got the same problem, can't get tcsh.zoo from new.

On a related point. MiNT 0.95 and MDisk appear to get on with each other
now, God Knows why but I can now use MiNT and have a ramdisk in TT-RAM
without conflict. I have noticed though that emacs 3.11 beta4 (the me version)
no longer seems to work. tcme however still works ok.

You might want to check in the MiNT directory - it looks like either
(a) Eric has some privileges at the archive, or (b) Jeff has gotten
back.

After a long hiatus, there's actually new stuff in /atari/newstuff!

1312. VT100 term programs

Newsgroup: comp.sys.atari.st
Date: 1992-08-05 14:51:30 UTC
From: psurge@cs.utexas.edu
Message-ID: <l7vqnilNN6qe@levelland.cs.utexas.edu>
Source record: 218881

Ok, I have asked this before, but nobody seems to know of a good VT100 term program.

I am using the Gulam shell and do quite a bit of calling to my unix account from home. For good VT100 emulation I use Uniterm, but I would prefer to have a smaller program that is JUST the emulation, preferrably a .TOS program, with no file transfer, dialers or anything. I hate loading up Uniterm, then quitting to a zmodem transfer, or even edit a local file with emacs, then re-loading Uniterm to continue the session.

The "te" program in Gulam would be
great, unfortunatly it is VT52 and I want VT100.

Does anyone know of a reliable term program like the one described above?

Thanks,

Troy Carpenter

There file /atari/mint/tcsh.zoo is dated 10 June 92. You need only refer to
the date of the original message to determine whether this is the 'latest'
version or not. (I believe it is .. and, in any case, it is the only version
of the file which exists in the current directory structure.)

> TOSWIN, I got that Cannot determine TERM type or whatever. I had TERM
> and TERMCAP variables set everywhere I could, and still it wouldnt work...

Actually, TOSWIN sets TERMCAP to a complete description of itself,
and TERM to "tw52" so that the program will use the description in the
TERMCAP environment variable. Neither variable should need changing
with programs that have a good termcap library. If you do find problems
with some programs, I would suggest copying the TOSWIN TERMCAP=
variable into your /etc/termcap file. You can do this relatively
easily by opening two windows; 1 with an editor, and 1 with "cat".
In the "cat" window type ESC-T-return. The ESC-T will cause TOSWIN
to send back its TERMCAP string; you can then select this with the mouse
and paste it into the editor window.

(TOSWIN provides a number of enhancements over the ST's "normal" vt52
emulation; see TOSWIN.DOC for details.)

mforget@ersys.edmonton.ab.ca :

The phone number for the CodeHead Quarters BBS is (213) 461-2095.

It costs $10.00 per year for full access. This is truly a negligible sum when you consider what you get for it. You get 90 minutes a day online, lots of files, and a fast-moving message base. It's worth it, I think. The registration process is fairly painless - you can do it in Email with a VISA or other card.

>a modem with 14400bps I notice that the display is still running while
>the recieve LED is already out. Obviously Uniterm can't keep up with
>the modem...

btw, with a 16 MHz CPU uniterm is fast enough for 19200... at least if
you assume that something like `at&v&v&v&v' does send at full speed,
wich i think it does when i look at the LEDs. :-)

>Other programms (Rufus, CoNect) seem to be even slower.

no wonder, there's nothing slower than GDOS... (ok, except maybe GEMDOS
without MiNT, but thats not very usable anyway.)

btw, similar problem with MiNT's new toswin.acc: nice program (i'm using
it right now :-) , but the screen output looks clearly slower than `good
old' mw2. (mw2 didn't use GDOS, toswin does.)

>Did anybody actually measure the speed at with any specific terminal
>programm can display it's input ? Anything better than Uniterm out there ?

something that uses MiNT's /dev/fasttext shouldn't be bad... like this
nice little tip in a.a's mint directory, that failed the `19200 bps at&v
test' probably only because it still uses single character BIOS calls
instead of read() + write() + select().

>- Jan
have fun...
Juergen

PS: in case anyone wonders: at&v is the `show setup' command on many modems.

Source record: 218886
Cross-posted to: comp.music,comp.sys.atari.st

Version 1.1 of Hans Kuykens' MIDI2TeX package has just been released, for Atari ST and PC clones. (This package takes MIDI files as input and puts out musical notation in TeX...) I've just ftp'd the ST version to atari.archive.umich.edu, in music/st_m2t11.arc. Currently both versions are available from obelix.icce.rug.nl; I imagine that they will soon be showing up on other archive sites as well.

On obelix, go to pub/erikjans/MIDI2TeX, and get st_m2t11.arc or for the PC, get pc_m2t11.exe.

and another vote for elvis from me...

> The others offer only a small
>subset or try to improve on vi. No matter how sensible these improvements
>are, they make it very annoying to use the editor.

oh, elvis also has improvements! :-) one of my favourites is :make, that writes make's stderr to a file and then you can step throu all source lines that had errors in them and you can easily correct everything.

> However, Elvis is
>not exactly perfect. Most annoying are:
>- Its complaining about lines that are too long. I don't know why but
> for many files it thinks that there are lines in it that are too long

well it writes its tempfile in 1K blocks (or 2K... whatever it was compiled with) and it doesn't want to have lines crossing block boundaries. so 1024(3?) characters is maximum for one line... (or 2048, 4096, etc)

> (there aren't; in fact, often these files have been written in a previous
> session with Elvis!), and it then (sometimes!!) inserts newlines at
> a random position in a line.

aah i see... you are using some turboC binary, right? must be a compiler bug or something, at least i haven't seen that again since the day `my' elvis is compiled with gcc. (in fact, as i remember there were quite a few more things that never really worked right in that version... btw, does yours also crash under MiNT? :-)

>- Its enormous hunger for temporary disk space. Just like the real vi,
> it wants to write a temporary file to record changes in the file
> that is edited, and allow the user to recover after a crash. However,
> this requires very large temporary files, often larger than the file
> that is being edited.

hmm, many people have more space on disk than in RAM... at least i like this much better than all those wonderful GEM programs that first

grab all available memory before they do anything. one vi never takes
more than 200K...

> Ofcourse you can use a ramdisk, but for files
> of any size you will need a very large ramdisk. I would like
> to switch this off.

yes, but then the data still would be in RAM...

>You have been warned..

:-)

cheers,
Juergen

1323. Is it possible to boot from SCSI:0 LUN:1?

Newsgroup: comp.sys.atari.st
Date: 1992-08-05 20:35:48 UTC
From: selick@csa.bu.edu
Message-ID: <92934@bu.edu>
Source record: 218890

Title pretty much says it all. Is it possible to boot from SCSI:0 LUN:1? I have a supra host adaptor, an adaptek 4000 scsi->st-506 adaptor, and 2 st-506 drives hooked up to it. On that note, does anyone know why a hard drive (this is definately the drive, not the controllers) will power up, and when it hits operating speed, it will slow down, then try again, then slow doen, and do it a few times, then give up and die? It usually works fine...could it be heat? What else?
Thanks,
Steve

Message-ID: <gate.aZ02oB1w164w@status.gen.nz>
Source record: 218967
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,news.group,

Subject: RFD: comp.sys.atari.znet
Followup-To: news.groups,comp.sys.atari.st
Sender: jonc@status.gen.nz (Jon Clarke, Z*NET PC Assistant Publisher)

Request For Discussion (RFD): comp.sys.atari.znet

Status: unmoderated

This is an official Request For Discussion (RFD) for the creation of a
Usenet newsgroup called comp.sys.atari.znet

Charter:

Comp.sys.atari.znet is for discussion of all aspects of the ASCII Magazines
produced by Z*NET including feeds from Z*NET FNET (FoReM NeT, Gatewayed via
The Z*NET Global News Gateway "status.gen.nz") also including discussion on
all aspects of the following

- Atari Explorer On-line
- Z*NET PC
- Z*NET Fido echo's (Zone 3)
- Z*NET FNET

Topics would include those current discussed in the Z*NET FNET echo, GEnie,
Delphi, Compuserve, Bix, Fido and comp.sys.atari.st which cover Z*NET Topics

- Letters to the Editor
- Current issue feedback
- Columnist's reply
- Letters to the Z*NET Global Crew
- Atari Explorer On-line
- Z*NET PC
- Z*NET FNET echo's
- Z*NET Fido echo's (zone 3)
- Z*NET Pacific
- Z*NET Europe
- Z*NET USA
- Z*NET Canada

Topics will also include an open forum to discuss topics of interest with the
Director of Communications at Atari Inc, USA and will be open to all Atari
based computers ie 8bit Series, ST Series, PC Series etc. Feedback will be
gatewayed back to fido net and FNET thus allowing a great interaction of users
across three networks.

Discussion of this proposal should be posted to news.groups. As per the Guidelines, discussion that occurs there is the only discussion that counts. If your site does not carry news.groups, and you are interested in this discussion, get your administrator to carry the group.

Message-ID: <1992Aug05.213700.24498@convex.com>
Source record: 218892

[complaints about less and other stuff deleted...]

since i openned my yap and mentioned i had my own less 177 that actually works, and since i have received numerous mail requests for this (and an updated nroff), i will try and post this stuff this weekend. you can stop sending me mail, people. i'll do it.

i will post to atari.archive in the new directory (~ftp/atari/new) since that is the only place i have access. you won't be able to do a dir list there, so watch for an article here giving the file names to grab. i will only post there and will not take mail request (since there are too many for me to do individually).

i will post the following:

- "my" port of less 177 that works under MiNT. at least an executable, perhaps src diffs, too, if i have the time. (note that we run into a possible problem with multiple versions. i'll figure out a solution to that and tell u what it is.)

- an executable for GNU make 3.60 that i use. src diffs maybe. (i say "maybe" since my src is a combination of make 3.59 and 3.60 and might be difficult to diff to 3.60. i have no particular plans to move to 3.62 in the near future either since 3.60 does everything i need, so far...)

- src+executable for a new version of nroff (if i can get the -T stuff done this weekend)

- src+executable for a new manpager

- executable for unix "more". maybe src, too, if i can find them

all are now ported to GNU C 1.40 with MiNT libs at PL 19. all are well tested under TOS 1.2 and MiNT 0.94 on a mega4. since i only use MiNT now, i won't be able to test under non-MiNT so you are on your own. since i also use only tcsh, bash/ksh/etc users are also on your own. i don't really think there will be any problems, but i am not going to fix them if there are (unless they pertain to my particular environment and the way i use it).

ok?

>

The ROMS that Spectre uses are the same ones in an SE which can run System 7. It's not the Roms but the hairy code in System & that is causing the problems. There were a few posts awhile back by Small complaining about Apple's coding. I half suspect they pulled a few tricks to keep from working quite right on Amiga and Atari Emulators. But, why attribute to malliciousness what stupidity and blind buracracy will explain.

And I believe that Outbound is required to get their Roms from dead Macs. I heard (it's tagged in the "unconfirmed" section of my mind) that they were also required to send the circuit board they got the ROMS from with the Outbound. There is a law suit/ and (out-of-court?) settlement between Outbound and Apple as well. I'm not quite sure that Dave Small wants to fall into that category yet, but I won't presume to speak for the man.

Source record: 218896

ekrimen@wet.UUCP (Ed Krimen) writes:
: In article <1992Jul30.053208.736@quando.quantum.de> vombruch@quando.quantum.de (Stefan vom Bruch) writes:
: >I hope there are not too many ST users out there who share your opinion
: >that there is nothing to worry about.
: I never said that there was nothing to worry about. If I implied that,
: then I'm sorry because I didn't want to. There's lots of stuff to worry
: about, but it seems that much of it is out of our control.
:
: What I find amazing is that of the three (?) responses so far that I received
: about what kind of software people want, two said that they want games. It's
: interesting because I've had the impression that many people want Atari to
: shed its game image.
:
: Pattie, yeah, something like Photoshop would be real nice. (I haven't seen
: ColorStudio.) I think I mentioned INVISION Elite here a couple of days ago.
: It reminds me of Photoshop, but it's only monochrome. The author says he'll
: add color support contingent upon the response of the monochrome version. I
: think it's imperative that he adds color support immediately. There are a
: few color boards out now and his program looks like it would work wonderfully
: with them.
:

Complaining about the lack of games rather than the lack of professional software from the ST software market isn't "interesting" - it's only logical. There's heaps of very good professional software available for the ST.
I don't know what Photoshop or ColorStudio are like but when I think of image processing software, "Repro Studio Pro", "tms Cranach Studio", "Retouche Professional"... come to mind - most if not all of them supporting true color (24bits), so to use them you'll probably need a TT (or Mega STE at least), a harddisk, a large color monitor, a color board and the software of course. For a dabbling in image processing that is just a bit too much for me - and I think that goes for most ST users. Even if there is no need for additional hardware with the Falcon, I still wouldn't want to spend $$$$$ on the software.
The software was written because the ST is a very good machine - not because it's a very good games machine. Still, if that's all the software that will be available in the future, there won't be many people using the ST (or the Falcon for that matter). Good, value-for-money-software will only be written if there are enough people to use it. And there will only be enough users if there's also a good deal of recreational software available.

And as an answer to your first article, there is some other software I would like to see on the ST, and this is not a game: How about some raytracing/ 3D-modeling software that includes texture and bump-mapping and allows

animations (something like Autodesk 3d Studio 2 for the PC, or like Antic's Cyber-series for the ST but much more advanced) - I don't think, it would make much sense on the ST (the resolution being what it is) but it would on the Falcon...

: Hopefully with ICD's Link, the ST will get some CD-ROM support. (We sure do
: a lot of hoping around here. :^) I wouldn't necessarily expect many of our
: own CDs, although there are some out there already, but instead I would expect
: to see front-end drivers for some of the CDs that are available for PCs and
: Macs.
:

YES! - I don't think hooking up a CD-ROM-drive to the Falcon should be much of a problem (as it's supposed to have an SCSI2-interface) so that leaves only the drivers to be written... Besides, this could work out very well for the software companies: they could release one product (one CD) for both machines and wouldn't have to worry much about software piracy either.... Let's hope for the best.

Ciao, Stefan

From: tan@ux1.cso.uiuc.edu
Message-ID: <BsJzFD.FvD@ux1.cso.uiuc.edu>
Source record: 218898

have a really great Amiga 500 system with color video digitizer
that I need to sell. I'm asking $450 for the hardware, and a little
bit more for all the software (about 250 disks)

Amiga 500
1 meg RAM w/ Clock
Golden Image mouse
Original (working) Amiga mouse
Master 3a Disk Drive
Epyx Joystick
Commodore 1084S (color monitor)
Flicker screen for monitor
Digiview Gold (Color video digitizer)

All the hardware is in perfect condition, except for the monitor, which
has a minor flicker once in a while. Send email if you're interested.

Thanks,
Andy

> ones I have to be able to run system 7? Should it not be a SPECTRE
> software update taking care of that. I mean my good old Mac Plus runs
> just fine with system 7. Or did I just get your question all wrong?

You are right. If Sys 7 shall ever run on Spectre, at least version 3.1
is required (and nobody knows if there will ever be a 3.1 release :-(
There ain't no chance to get it work with Spectre 3.0, neither on the ST,
nor on the TT, and I can recommend not to check it out, it will shoot
your partitions (guess: how do I know ? :-((

I cannot understand anyone's fascination for Sys 7. For me, a stable
system is much more important than an OS with eats up my RAM hungrily
just for showing some nice 3D MOTIF-styled windows, but crashing with
most apps that were released before Sys 7.

Remember: 6.0.5 is it!

Markus.

Hello all! I have alot fo stuff to sell so here goes... ALL prices
are plus shipping:

****
AT&T 7300/3b1
1 meg RAM
20 meg HD
1 serial, 1 parrallel
1200 bps modem
Foundation and Development Sets
All Docs

Lots of gnu things already installed. A great machine
to get started with.

Price: $350
****
Magnavox RGB Monitor -- works with Atari ST
Price: $200
****
Human Design Disk -- for CAD 3D on the Atari ST
Price: $10
****
Astra Monitor switch box -- works with Atari ST
Price $15
****
Maxtor XT 1140 MFM 140 meg hard drive
Price: $200
****
5.25 360K disk drive
Price: $10
****
Norton Utilities 6.0
The latest one I think... really nice set of utilities!
Price: $50
****
Power C
This really is the best C compiler I have seen for the IBM
PC. It comes with a really nice manual too!
Price: $15
****

Email inquiries to: DGray@uh.edu Some prices are flexible...

You can get proff from atari.archive; I think it sits somewhere near the ProGEM tutorial stuff.

watch out when reading the Hermes documentation. There's a file called
"xhosts.txt" within /usr/man/man5. 95% of this text are written in German,
but the reminding 5% are written in English and describe the xhosts file.
This only true for newer docs (1.03 and higher), if you are an older version
you should update ASAP.

I think that some more netters would like to have this infos, so I'll
post them here...

-------------------------cut here-------------------------

The following lines are really one line that has been split
to fit on the page. You can split lines in the file by putting
a '\' character at the end and an arbitrary number (even zero)
of whitespace characters on the beginning of the following line.
The ellipses here is used only for clarity and will NOT work in
the actual file.

```
site%site.domain|atx4b0e0s10=20m0|0:15/3/0-7%W0-7%W18-24| ...
^ ^ ^ ^
| | | \_ List of poll times (empty for manual
| | | polls only). Time before the first
| | | slash is redial time in case of
| | | failure, time before the second slash
| | | is minimum time between automatic polls
| | | (this is an oversimplification). Both
| | | are optional. The rest of the line
| | | consists of '%'-separated call times,
| | | optionally prefixed by 'W' for work
| | | only (anything to transmit), and
| | | any string of "abcdefg" for Sunday,
| | | Monday, ..., Saturday. No day letters
| | | are equivalent to "abcdefg".
| | \_ Modem initialisation string
| \_ Alternative names, separated by '%' characters.
\_ Primary name of neighboring site

...|2400|tel1%tel2|ogin:|<name>|word:|<pw>|<spooldir>|n1|n2
^ ^ ^ ^ ^ ^ ^ ^ ^
```

```
| | | | | | \__\_ internal time
| | | | | | | fields. Set to
| | | | | | | "0" when creating
| | | | | | | an entry.
| | | | | | \_ Spool directory. Every site
| | | | | | must have its own. Files that
| | | | | | are to be sent to that site
| | | | | | go there.
| | \_____\______\_____\___ Login chat. Must be
| | exactly four entries long,
| | BREAKs and new lines are
| | sent automatically
| \_ List of telephone numbers or "DIR" for direct connection.

--------------------------cut here-------------------------

>One last quick question. Is there a cron that can be run under
>MiNT? when I sent local mail, it spooled up under the mqueue directory,
>but I needed to issue rmail by hand before it got delivered.
If you get one, there's at least one who would CERTAINLY like to have a copy.
Your mail delivery problem can be solved without a cron: There's a statement
called "doqueue" within the config file (statement 107). It should look like
this:

0107 "C:\GEMINI\MUPFEL.APP -c H:\HERMES\ETC\DOQUEUE.MUP" # DOQUEUE

This statement is executed before a call, it starts a shell (Mupfel) with
a simple batchfile like this one:

rmail
rnews

That's all, and your mail delivery problem will be gone (the directory where
these two programs are located is within my PATH, you may have to add the
paths and extensions in your installation)
/s/
PS: Don't forget to pay the shareware fee if you continue to use Hermes.
PS: The english/german mixture within the docs is typical for Hermes, the
author is quite busy and therefor he could only translate the important things.

The vault 3.XX does accept 1.44 Hard Disk (even those formatted with only
one sector per cluster, that's a problem of TOS < 2.06/3.06, not the vault).
Works fine on my Mega ST (or what's left of it, expanding, expanding)....

No, I mean meta.sys. It is supposed to be a GDOS driver that allows
programs such as Easy Draw to write .GEM metafiles; the Atari standard
vector graphic.

Hi. I'm posting this for a friend who has no newsgroup access. Please
mail replies to cmeli%panther.uucp@carla.dist.unige.it, though if the
mail bounces back, then send it to me and I'll forward it.

Mike

I am going to buy a Protar Series II 100M hard disk and am thinking of
upgrading my operating system from TOS 1.2 (UK) to TOS 2.06.
Has anyone encountered any problems running the pc-ditto software emulator
with TOS 2.06? Does pc-ditto work with the Protar drive?
My ST is a 1040 stf. Does TOS 2.06 (the USA version) work on a british
machine or are there any problems?

I can be contacted at cmeli%panther.uucp@carla.dist.unige.it

Hi Thomas.
I tried running buildact.tos. It quits with an error -33 (file not found?).
If that does mean file not found then what file?
I even tried running SYSMON, to see what files it's trying to open, but either it's not making gemdos/bios calls to open files, or is doing something weird that sysmon can't trace.

Btw the size of my 'buildact.tos' file is 11008 bytes.

I have NVDI installed on my system, and I haven't had that problem. Perhaps it's some other program in your system that's conflicting? You could try various combinations of BIOSBUF={YES,NO} and try with and without CON=u:\dev\fasttext in your mint.cnf.

If all you need is a VT100 terminal, what about the Atari VT100
cartridge? You don't have to load anything, and it is only $9.99 at
B&C Computervisions.

I'd get one, but... what do I need a VT100 terminal for?

>When I run `rmail it's looking for a file in \usr\spool\r-node\
>then aborting without creating the 'C' file and the other files
>in \usr\spool\r-node\ for `ucico to process.

Well I solved my own problem. By making sure `rmail was called through a script for `hush, by invoking `uuwork, everything is fine again.

I could have sworn that I was able to run `rmail from the `hush prompt and have it work properly.

Oh well, it's working again.

Now ..... to get that 'NN' program going !!!

1356. The future of MiNT and MultiTOS on the Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-08-07 12:49:01 UTC
From: dac@ukc.ac.uk
Message-ID: <1428@eagle.ukc.ac.uk>
Source record: 218975

As the new Atari Falcon is to use a kernel based on Eric Smith's MiNT,
and as Eric Smith is still developing and improving MiNT, are the
subsequent improvements and new ideas likely to be incorporated into
future releases of MultiTOS now that Allan Pratt is no longer in the
picture, or is a Falcon compatible MiNT likely to be installable over
MultiTOS?

1358. Graphics Library v1.1

Newsgroup: comp.sys.atari.st
Date: 1992-08-07 15:17:20 UTC
From: hartlenk@newton.ccs.tuns.ca
Message-ID: <1992Aug7.151720.5486@newton.ccs.tuns.ca>
Source record: 218980

Hi everyone,

I've just uploaded the file graphx11.zoo to a.a.u.e in the
atari/new directory.

This file contains the latest version of Graphics Library, a
Turbo C v2.0 compatible graphics library for Lattice C and
Sozobon C. This library allows to to compile your Turbo C code
that uses the graphics library, on your ST.

I wrote this library for my own use and thought others may
be interested. BTW, its FREEWARE.

You should see Lexicor's Software. Cyber-compatible, 3D animation, with renderer, although I don't think they have bump-mapping. They're in the process of adding Spectrum 512 support because there are many ST users out there who wouldn't be able to fit their STs with graphics cards, either for financial reasons or practical reasons. They're also porting their software to the Silicon Graphics machines, basically to stay in business as I understand it. :^/ Apparently, they've also had a Falcon for quite a while, working on software for that.

>MultiTOS?

Or better yet, is Eric Smith getting paid big bucks from Atari because
MiNT is being used for Multi-TOS? Or is he getting paid anything at all?

I really don't care how much he is getting paid, though I hope it is
something. He is saving Atari a fortune because of his MiNT.

I just realized that this is being crossposted to news.group, not
news.groups! Normally discussion of new groups should take place
exclusively on news.groups and not be crossposted. I suspect that
the original RFD contained the same error, so it needs to be posted
to news.groups before it will be valid.

Please move the discussion to news.groups. If your site does not receive
news.groups, talk to your system administrator and fix it. If you do not
want to read all the other messages on news.groups, learn how to use a
kill file with your news reader (I use nn and it is quite trivial).

From: rost@rgb.dec.com
Message-ID: <1992Aug7.154131.9260@ryn.mro4.dec.com>
Source record: 218981

I'm looking into buying a Mega STE as an upgrade from a 1040ST. Talking to a mail order dealer here in the US, the Megas are currently being shipped with the HD floppy and TOS 2.05, although 2.06 chips may be purchased separately for $60.

I have heard that 2.05 is buggy, the dealer says only in oddball cases. He agrees that Atari should be shipping with the latest OS but will not install it himself without the $60.

Does anybody know the REAL story about bugs with 2.05? Is it worth buying the 2.06 ROMs now or waiting? Has anyone had to upgrade from 2.05 to 2.06 because of bugs they ran into?

Thanks for the input Bill. I am sure alot of Atari Users in the USA and
our here in the neither world will enjoy seeing the Z*NET FNET feeds.

I currently have them going on my system here status.gen.nz and the
usage is very high to say the leaste.

Hope your system gets the articles in news.

```
Subject: RFD: comp.sys.atari.znet
Followup-To: news.groups,comp.sys.atari.st
Sender: jonc@status.gen.nz (Jon Clarke, Z*NET PC Assistant Publisher)

Request For Discussion (RFD): comp.sys.atari.znet

Status: unmoderated

This is an official Request For Discussion (RFD) for the creation of a
Usenet newsgroup called comp.sys.atari.znet

Charter:

Comp.sys.atari.znet is for discussion of all aspects of the ASCII Magazines
produced by Z*NET including feeds from Z*NET FNET (FoReM NeT, Gatewayed via
The Z*NET Global News Gateway "status.gen.nz") also including discussion on
all aspects of the following

- Atari Explorer On-line
- Z*NET PC
- Z*NET Fido echo's (Zone 3)
- Z*NET FNET

Topics would include those current discussed in the Z*NET FNET echo, GEnie,
Delphi, Compuserve, Bix, Fido and comp.sys.atari.st which cover Z*NET Topics

- Letters to the Editor
- Current issue feedback
- Columnist's reply
- Letters to the Z*NET Global Crew
- Atari Explorer On-line
- Z*NET PC
- Z*NET FNET echo's
- Z*NET Fido echo's (zone 3)
- Z*NET Pacific
- Z*NET Europe
- Z*NET USA
- Z*NET Canada

Topics will also include an open forum to discuss topics of interest with the
Director of Communications at Atari Inc, USA and will be open to all Atari
based computers ie 8bit Series, ST Series, PC Series etc. Feedback will be
gatewayed back to fido net and FNET thus allowing a great interaction of users
across three networks.
```

Discussion of this proposal should be posted to news.groups. As per the Guidelines, discussion that occurs there is the only discussion that counts. If your site does not carry news.groups, and you are interested in this discussion, get your administrator to carry the group.

B&G ELECTRONICS 1-216-521-2855 has new Golden Image 3.5" drives for
$159.95. They also, from time to time, have used 3.5" drives. Usually
selling at about $125.00 (depending upon quality).

> picture, or is a Falcon compatible MiNT likely to be installable over
> MultiTOS?

I've received several pieces of e-mail from people who are worried about
this, so I guess I should reply publically:

(1) I've spent a lot of time emphasizing my distance from Atari: I'm
not an Atari employee, I can't speak for them, and it's entirely
up to them what goes into MultiTOS. Perhaps I spent too much time
emphasizing those things and not enough emphasizing the other: that
I do have a good working relationship with Atari. The MiNT source
code is available to them (as it is available to everyone!), and I
for one don't want MultiTOS to be based on an out-of-date version
of MiNT. Neither does anyone else that I know of. I _believe_ that
Atari is continuing to work on its version of MiNT, and that it
will by and large be a superset of the publically available version
of MiNT; but I cannot make a more authoritative statement than that,
because it is Atari's product, not mine.

(2) I was sorry to see Allan go (although I can certainly understand why
he chose to take a job with Taligent; it sounds like a great opportunity).
But there are lots of other good programmers at Atari (e.g. Ken
Badertscher and John Townsend) who are continuing to work on MultiTOS.

(3) Several people have asked about whether I'm getting a lot of money for
MiNT. The details of my license with Atari are confidential; I cannot
reveal them. I've said before that Atari got a good deal. You may take
that to mean that I'm not getting rich from this. I did, however, get
what I asked for from them (in fact, they gave me a bit more than I
asked for). In other words, I *offered* them the good deal, and they
accepted. Both parties are (so far as I know) satisfied.

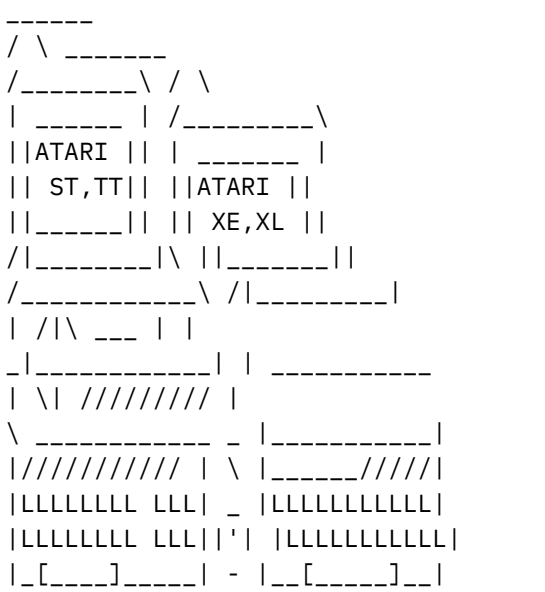
1373. Cleveland Free-Net Atari SIG Announcement

Newsgroup: comp.sys.atari.st
Date: 1992-08-08 02:23:53 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992Aug8.022353.21395@usenet.ins.cwru.edu>
Source record: 218995

INTRODUCING...

The NEW...



CLEVELAND FREE-NET ATARI SIG

The Atari SIG is a Special Interest Group servicing all Atari computer users and Lynx video game players. The SIG Operators that help run the Atari SIG are volunteers that have an interest in Atari computers and Atari products. The opinions of each SIGOp do not necessarily reflect the Atari SIG nor that of the Cleveland Free-Net. The Atari SIG is run by individuals and is no way affiliated with Atari Corporation. The "Atari" name, logo, and any other Atari products mentioned here are copyrighted by Atari Corporation. The Atari SIG is made possible by the NPTN, CWRU, INS, and you, the user who contributes time and information. The Central Atari Information Network (C.A.I.N.) is the official user group of the Cleveland Free-Net Atari SIG. The meetings are usually electronic and are held in the Multi-User Chat area on Free-Net. A live gathering of C.A.I.N. members is held once a year. The C.A.I.N. official newsletter is published in electronic form once a month. The Atari SIG can be accessed by the phone number: "216/368-3888" at either 300, 1200, or 2400 baud. It can also be accessed by users around the nation or world for free by using "telnet" at their college or business by the following Internet addresses: 129.22.8.82, 129.22.8.75, 129.22.8.76, freenet-in-a.cwru.edu, freenet-in-b.cwru.edu, cwns16.INS.CWRU.Edu, cwns9.INS.CWRU.Edu, or cwns10.INS.CWRU.Edu. There is no charge for the use of the Atari SIG or the Cleveland Free-Net. The information within

this SIG is believed to be reliable but cannot be guaranteed.

In the Atari SIG, there are many different areas which you may use. We ask that you help out in these areas because we cannot make the Atari SIG a success without you.

Here is a small overview of each section in the Atari SIG:

One of the first sections is the SIG Menu Outline. This outline is here to help you find what you are looking for in this SIG.

The Atari News area is the place to go for all of the latest news relating to Atari. In this area, you will find the Atari News (All) board, the Atari SIG Newswire (Weekly), the Free-Net Atari SIG Newsletter (Monthly), Atari Show Announcements listing, and a Rumor Mill board that does not require users to leave their names when posting rumors.

The General Bulletin Board is the main place for Atari computer users to meet and discuss any problems, suggestions, or experiences that they might have.

The 8-Bit Computers Support Area is the place to be when it comes to support for the 8-bit Atari. This area includes a computer description, FAQ list, 8-bit news, bulletin board, programming forum, product summaries, product reviews, tips & tricks board, file area, all Z*Magazine issues, recent Info-Atari8 Digests, and an 8-bit user directory.

The 16/32-Bit Computers Support Area is here specifically to meet the needs of the ST, TT, and hopefully new Falcon computer users. There is a published articles board, a computer description file, FAQ list, 16/32-bit news, bulletin board, MIDI forum, programming/developing forum, tips and tricks board, file area, online magazines, and 16/32-bit user directory.

The Portfolio Support Area brings support to users of one very small computer. The area includes a description file, Portfolio news, bulletin board, programming forum, product summaries, product reviews, tips & tricks board, file area, Portable Addiction Magazine, and a Portfolio user directory.

The Lynx Support Area is for owners of the first color portable video game system (not to mention the best). There is a description file, published articles board, FAQ list, Best & Worst of 1991 file, Lynx news, bulletin board, Atari Explorer game card summaries board, game card reviews, rank Lynx games area, tips & tricks board, record high scores reported board, APE Newsletter, Portable Addiction magazine, and a Lynx player directory.

The Wanted & For Sale Board is the market place for Atari users. This is where users may post messages to sell their equipment or just let others know what they are looking to buy. Businesses may not use this board to sell their merchandise.

In the Voting Booth, users are allowed to post and vote on Atari related issues. There are complete text files to help you in this area. It is a great new addition to the SIG.

The Atari Library is a place for users to get old Atari SIG news and information, Online Magazines, Atari SIG Newsletters, various documents in the Miscellaneous Information board, text files in the Information Base, and Atari SIG Logs.

The Atari SIG Newsletter is put together in The Newsroom area of the Atari SIG. All interested users should visit the area to see what they can do to help put together the newsletter.

The Help-Line is the place to ask general questions about your Atari computer. The SIGOps manning the Help-Line are ready, willing, and able to help. Your question will be answered as soon as possible.

And finally there is a directory of all the Atari SIG members. This section is a listing of all the Atari SIG members. If you are an Atari user and this all looks good to you then please take the time to sign up now and your name will be added to the list. Once your name is on the list, you may be contacted through personal messages if any important news should come up related to Atari or the Atari SIG.

The posting of any abusive, obscene, offensive, or inflammatory messages may be deleted. It goes without saying that illegal material is prohibited. Any illegal material that you post will be deleted and your Cleveland Free-Net access may be revoked.

If you have any comments or suggestions on how to make the Atari SIG better then please send the Atari SIGOps a message at:

xx004@cleveland.Freenet.Edu

Thanks goes out to all those who are helping in contributing news, online magazines, reviews, and information. Their names are listed in the header of the material that you read.

Thank you & enjoy,

Michael Current, aa700 (8-Bit Computers Support Area)
Peter Haller, aa596 (8-Bit,16/32-bit Programming Forum, MIDI Forum)
Fred Horvat, aa778 (Portfolio Support Area, Portfolio Programming Forum)
Mark Leair, aa338 (Voting Administrator, Newsletter Editor)
J. J. Lehett, aa400 (16/32-Bit Computers Support Area)
Scotty Meredith, aa519 (Newsletter Editor)
Len Stys, aa399 (Lynx Support Area, SIG Manager)
Doug Wokoun, aa384 (Atari News)

Your Atari SIG Operators

The Cleveland Free-Net has been upgrading systems and adding more server ports so if you cannot access Free-Net from the above nodes, try these:

freenet-in-a.cwru.edu = cwns5.ins.cwru.edu = 129.22.8.47
freenet-in-b.cwru.edu = cwns6.ins.cwru.edu = 129.22.8.48
freenet-in-c.cwru.edu = cwns6.ins.cwru.edu = 129.22.8.48

We hope to see you there!

Len Stys, aa399@Cleveland.freenet.edu

(Eric Smith) writes:

Along with the MiNT executables is provided a beta version of TOSWIN,
a really nifty (well, I think so :-)) new window manager that can work
as a .ACC. Unlike the old BGACC, this one supports arbitrary GDOS fonts
(including proportional fonts!), scrollback (like xterm), and allows
for dynamic resizing of windows.

The documentation for TOSWIN refers to termcap info for terminal type
tw52, which I assume is an extended vt52. I grepped through the source
and binary releases, and couldn't find a termcap entry. What is the
correct termcap entry for tw52?

Thanks!

I had 2.05 on my Mega STE and upgraded to TOS 2.06 as part of the HD floppy
upgrade. In my experience there were no MAJOR bugs in 2.05 although it
certainly did not handle the serial ports correctly. There are software fixes
for that problem.

>
>In a previous article, dac@ukc.ac.uk (David Clear) says:
>
>>As the new Atari Falcon is to use a kernel based on Eric Smith's MiNT,
>>and as Eric Smith is still developing and improving MiNT, are the
>>subsequent improvements and new ideas likely to be incorporated into
>>future releases of MultiTOS now that Allan Pratt is no longer in the
>>picture, or is a Falcon compatible MiNT likely to be installable over
>>MultiTOS?
>
>Or better yet, is Eric Smith getting paid big bucks from Atari because
>MiNT is being used for Multi-TOS? Or is he getting paid anything at all?
>
>I really don't care how much he is getting paid, though I hope it is
>something. He is saving Atari a fortune because of his MiNT.

In the readme file he says, " Please note
that their version of MiNT is *not* necessarily going to be the same
as this one (or any other freely available one) and that in particular
Atari is not obliged to be completely compatible with my MiNT." He was
quoted in a magazine as saying atari got a very good deal monitarily for
MiNT. Taken alone either of those statements makes sense, together they
make none at all to me.

I'd take that just as a legalistic precaution. He says only that their
version might be a bit different and that he can't sue Atari for that.
But they still use mainly his code (I'd guess they only redid code
that leads to complications with MultiAES, which there (I guess again)
won't be many).

So taken this statement apart with my knowledge from way back when I
took PHI Logic Intro. (har) there is no contradiction there.

Nat!
P.S. I hope Eric said "gimme some cash and 10% of the stock" on the license
deal. Might be worth something at the end of the year (har).

>Hi Thomas.
> I tried running buildact.tos. It quits with an error -33 (file not found?).
>If that does mean file not found then what file?

if i remember right this buildact did just exec sed... so a) you need
a sed in your $PATH and b) if your shell isn't completely brain-damaged
you can just as well replace buildact with a shell one-liner. (you will
always have to run it before nnmaster, not just for initialization.)

ok, but now there is another thing: does your news system (hermes?)
keep a min field in its `active' that you can use? if not you might
want to try if chkgrp (originally for mercury) works on your setup,
because having a min field makes it easier for nnmaster to expire its
database. (ie faster, and can be made `automatic'. see the manual under
`database expiration' for details... btw, nnmaster -F doesn't work cause
ARGV can't pass empty arguments, so if you don't have a reliable min
field you can only force expiration from nnadmin.)

>...

>>With an adequate active file, GROUP and MASTER are built correctly.
>>For securety reasons here is my configuration of the neccessary NN
>>variables.

you mean for safety reasons :-)

>>[nnadmin C output deleted...]

>Do these variables need to be set BEFORE I try to run buildact?
>If so how?

you might have to add a few missing environment variables in your
.profile, see nn's readme... (sorry can't tell you more cause its
too long ago.)

>I'm just about ready to junk this attempt at trying to get 'nn' to run.

hmm i too remember it took me a few evenings to install the thing...but
it was definitely worth it. and now with MiNT i can even read news and
write followups :-) while gcc is compiling in another window...

>Thanks very much for your suggestions anyway.

The correct termcap entry for tw52 is the one put into the TERMCAP=
environment variable by TOSWIN. You can also retrieve it by sending
ESC T to TOSWIN from one of the windows. These methods are to be
preferred over using a fixed /etc/termcap entry because (a) they
get the number of rows and columns right for the window, and (b) they
will always be up-to-date; if a future version of TOSWIN has new features,
those will appear automatically in the data supplied by that version
of TOSWIN.

Howdy,

I am running Mint 0.95 and tcsh 6.0.1 (I think) and I just grabbed
mntemacb.zoo from atari.archive. But when I try to run emacs, it says
term st52 not powerful enough to use emacs cursor positioning. But
the termcap entry is the one I got from the readme file for emacs.
Any clues on how to get it to work??

John

This has me fairly confused as well. The file was sent to the proper submission address, and I never heard of anyone downloading it from atari.archive as of yet. It was also sent to the comp.binaries.atari.st submission address, and yet again, I never heard or saw anything about it.

I wish I could tell you for sure just where it is, but I have no idea at all anymore. Maybe it is in the telecommunications directory already?

1388. Change serial no. (found program)

Newsgroup: comp.sys.atari.st
Date: 1992-08-08 23:56:03 UTC
From: d89-sla@nada.kth.se
Message-ID: <1992Aug8.235603.11446@kth.se>
Source record: 218911

Last week I was lucky to recieve 100 brand new disks for free.
Pre-formated too -- would save a couple of hours spent formatting,
or so I thought...

I soon found out that all disks had the same serial number, so TOS
wouldn't notice disk swaps.

Very bad... I didn't exactly feel like reformating 100 disks.

So I started thinking about writing a program that would replace
the fixed serial number with a random one, only to realize that
certainly there must have been someone else - as always - who
had discovered the same problem, and maybe already solved it.

And YES there was - I found this program called UNEEKIT by Ivan D Reid
at a.a.u.e which would do exactly what I wanted.

So if you have lots of disks with the same serial number, don't
reformat them, use a program like UNEEKIT instead!

1389. Transfer of text files between ST and MS DOS

Newsgroup: comp.sys.atari.st
Date: 1992-08-08 23:58:58 UTC
From: dluznie@bingsuns.cc.binghamton.edu
Message-ID: <1992Aug8.235858.16220@newserve.cc.binghamton.edu>
Source record: 218912

I need info on the possibility to read/write ST disks on a MS DOS computer or vice versa. Any suggestions on this matter will be appreciated, especially on software that could do the trick.

I want to be able to send 3.5" diskettes with text files (ASCII format) to my friend. He has an ST computer, I have access only to an IBM compatible. Communication through the modem is not feasible in our case.

Please e-mail me <dluznie@bingvmb.bitnet> or post the answer to this newsgroup.

Tomek Dluzniewski.

For the Mega STE, TOS 2.06 fixes a serial port bug and adds some more support for high-density drives. If you can live with a patch program for the serial port bug and if you don't use the high-density part of the floppy drive, then you don't need TOS 2.06.

I don't think you can, although I'd love to be proven wrong. As far as I know, the 4D and 4DS don't sync low enough to handle the ST color resolutions.

Any chance you want to trade for a 3D which does work? :^)

> if you could ask a competant programmer for something, what would it be?

For me: a universal install program for shareware/freeware. Something
that had builtin LZH or ZOO decompression, a simple scripting language that
would let you ask the user for simple options (like drive/path, install this
piece? {y/n}, that sort of thing). The program should run in either GEM
or CLI mode (that is, the same exe file should run right in both modes,
using GEM dialogs when run in GEM mode).

Public Domain tools and shareware is great stuff, but installing them is
a big pain in the butt for anything but a simple 1-program-with-a-document
type tools. I wrote a custom installer for Sozobon/HSC, but it needs little
tweaks for each differing release, and its dealings with compressed files
is a major kludge. I'd really like to have a generic install tool. (I'd
even pay for it, but not too much.)

In lieu of a script-driver universal program (writing a script parser is
a hassle, after all), I'd settle for an "install utilities library" that
had the decompression, file copying, verification that files installed
correctly, and that sort of thing. Then I could write the user interface
code myself (the new GemFast v1.8 makes writing simple dialogs much easier
these days), but link in the library for the bulk of the dirty work.

If anyone is interested in writing such a library, I'll be happy to put
in my two-cents' worth on the functions it should have and what its API
should like like.

> how to connect a NEC monitor to an ST

A couple months ago, I posted a big writeup on how to do that. I posted
it either here or in .tech, I forget which. You s/b able to do a search
of past news headers for 'multisync' to find it. Or, if you can't find
it, email me, and I'll mail it to you.

(I almost think that writeup s/b a FAQ item, as much as I see it asked for.)

> 3.5" disk to xfer between ST and MSDOS

No problem, I do it all the time. If you have TOS 1.04 or later, you can
format the disks on the ST (don't use twisted or other odd formats, just use
the desktop formatter). If you have TOS 1.0, the disks it formats won't
work on the MSDOS machine. In that case, just use the MSDOS machine to
format them.

Format the disk on the IBM, or if the ST is an STE (or higher) format the
disk from the desktop. It will then be treated as a standard disk by
both machines, and can be read & written to by both!

This SHOULD be in the FAQ, it has been asked about 5 times in the last
month or so - and is one of the ST's more obvious features to anyone
who has looked into it. If a disk is formatted on an ST with TOS 1.4
or higher using the desktop - most IBM contemptibles can read them -
apart from the ones using mutant OS's!

If a formatter other than the desktop format is being used on the ST.
Make sure the format is 09-sectors per track. 80-tracks (00-79).
2-sides. and DO NOT use a 'twister', 'fast' or 'skewed' sector format.
Formatting the disk to these specifications on the Messy-DOS machine
will guarantee compatibility.

You mean you want 14400 bps (that's V.32bis)? If you want only 9600 that's V.32. Anyways, much depends on what BBSes or services you call. If you call a lot to USRobotics HST modems (I mean HST not Dual Standard) it's probably best to buy USRobotics Dual Standard (CCITT up to V.32bis/MNP1-5/V.42/V.42bis and 16.8k HST) with or without FAX. However it's expensive and if you do not need HST and have not lots of money (I don't) you should consider some other brand. A warning though... I've heard that Supra V.32bis FAXmodem has problems with heat (ie. it overheats) otherwise it's fast & cheap. You should read comp.dcom.modems for more info.

I've just put IdeaList3.20.zoo on tupac-amaru.informatik.rwth-aachen.de in
directory /pub/atari !

Idealist has become Shareware with the new 3.2 release. Shareware fee is
20,-DM (~ US$ 15).
Improments of the new version:
Supports upper/lower/left/right margins and gives you the possibility to select
the amount of space between text columns.
You can select whether FFs in a given text will be ignored or not (in the
latter case, Idealist will continue with text on the next page).
Pages can be printed in backward order (ideal for Deskjet handling due to
face-up ejection... plus some other new features. Just take a look at it...

bye,

Benedikt

1410. Elvis 1.5 (esp. for MiNT) - How would you like it?

Newsgroup: comp.sys.atari.st
Date: 1992-08-10 01:03:29 UTC
From: warwick@cs.uq.oz.au
Message-ID: <9752@uqcspe.cs.uq.oz.au>
Source record: 218930

I ported Elvis 1.4 to MiNT last night - the BSD configuration works fine.
I've grabbed Elvis 1.5 and I'll port it again tonight.

HOWEVER:
The TOS version I'm using at the moment has a very nifty
representation for non-ASCII keys (eg. approx. "#<s>Help" is sent for
the Help key). Such things are trivial to implement, but we should
use some system that everyone agrees on. Here are some choices:

1. Use the Stndard Elvis TOS configuration, whereby non-ASCII
keys are sent as "#n", where "n" is the scancode (as
a character).

2. Use the system that is provided by the Elvis (elvis-1.3.1) at
atari.archive ported by Jan van der Steen.
format:

#<code><code><...><key>

where code is:

s <shift-left> || <shift-right> || <caps>
c <ctrl>
a <alt>

and <key> is an ascii representation of the key involved:

function f1 f2 ... f10
keypad k0 k1 ... k9 k+ k- ke k. k(k) k/ k*
special <Home> <Del> <Ins> <Help> <Undo>
cursors <Left> <Right> <Up> <Down>
isspace <sp> <tab> <bs>

I will also do the following changes which Jan van der Steen made:

Enlarged MAXMAPS to 300, to allow more key mappings.
Enlarged LONGKEY (lhs of "map" command), to 20 for long keynames.
Enlarged MAXRCLEN to 4000, for a large elvis.rc/.exrc file.

I also remember some discussion on this earlier when a European atarian
complained that Elvis keymappings did not let him/her use the European
keyboard very effectively - is there a solution that needs implementing?

So, which way?

There should be no problem at all. I'm not sure how you're going to be
formating the disks in question but any ST should be able to read any
standard 720K formated IBM disk. You therefor just need to format your disk
Disk in a 720K format and copy the ASCII files in question to the disk.
You can then mail or give the disk to your friend and he/she should have
no problems reading them in his/her ST.

P.S. I'm sorry if these post comes a little garbled. This is the first
post I've made and I'm not use to the text editor I'm using.

> atari.archive ported by Jan van der Steen.

A third option would be:

3. [Pre]map each non-ASCII key according to a file of strings.

This has the advantage of being able to implement (1.) and (2.), and also
support any non-ascii "foreign-language" characters, EVEN IN : commands!

The disadvantages are that it uses more memory (sizeoffile + 256*4 bytes,
probably adding to about 2K) and complicates the configuration process.
But I like it.

>can just as well replace buildact with a shell one-liner. (you will
>always have to run it before nnmaster, not just for initialization.)

I do have sed in my path and it is getting executed.

It returns a message 'sed: garbled command s/|\([0-9]*\)/'

What would be the shell one liner ?

>>I'm just about ready to junk this attempt at trying to get 'nn' to run.

> hmm i too remember it took me a few evenings to install the thing...but
>it was definitely worth it. and now with MiNT i can even read news and
>write followups :-) while gcc is compiling in another window...

I would like to install it, it's frustrating to know that others do have it
running.

The docs seem to be generic nn and nothing is mentioned on installing
specifically for the ST.

: >formatter program, try a recent version of PumpUp from Claus Brod.)

I'm currently using Diamond Format (from the same people who make the
commercial hard drive backup program Diamond Back) which is on
139.174.1.3 somewhere- it supports 1.44 Mb disks, up to 82 tracks and
20 sectors and twisted disk formats, and comes in .PRG and .ACC flavours.
Very nice looking too!

: The vault 3.XX does accept 1.44 Hard Disk (even those formatted with only
: one sector per cluster, that's a problem of TOS < 2.06/3.06, not the vault).
: Works fine on my Mega ST (or what's left of it, expanding, expanding)....

Yup, I tried this and the Vault 3.?? writes to HD disks quite happily on my
ST as well (STFM, 4Mb RAM, TOS 1.4, ICD software) so until I can afford to
buy Diamond Back that's what I'm using.

(Eric Smith) writes:

Along with the MiNT executables is provided a beta version of TOSWIN,
a really nifty (well, I think so :-)) new window manager that can work
as a .ACC. Unlike the old BGACC, this one supports arbitrary GDOS fonts
(including proportional fonts!), scrollback (like xterm), and allows
for dynamic resizing of windows.

Has anyone else had the problem of toswin corrupting the fonts used by other programs? I'm running Gemini v1.2 , and Rufus for comms. Rufus normally puts a status line at the top of the terminal in the 6x6 system font, and this seems to come out as the 6x6 font, but in about 16x16 pixels. Looks horrible and ruins the idea of the status line, as it goes off screen.

I *like* Rufus, it's a very nice 'comms-in-a-window' accessory, though I've only used it for a short time. I'd not much like to get rid of it. Toswin also seems to interfere with GEMini

Do I have to get rid of my favourite programs to use MiNT ? (say No! :-)

Simon.

1416. Neodesk icon limits

Newsgroup: comp.sys.atari.st
Date: 1992-08-10 12:39:43 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1992Aug10.123943.23469@aston.ac.uk>
Source record: 218937

Hello there.
I'm using Neodesk 3.01 (UK Version) and I wondered if there was any way around the limit to the number of custom icons you can install. The manual says the program will tell you when you run out- on my machine the limit appears to be 101 icons, but as it isn't listed in the "Neodesk limits" section of the manual I wondered if this was fixed or if I could patch it in some way. I've still got some 3 Mb of clear memory left, so I doubt it's due to that! I've seen .NIC files with up to 130 icons in, so it looks as if someone has been able to fix it. E-mail to me, and if I get a solution I'll post it.

>I agreed. Elvis.

Elvis has my vote too despite the problems. I can live with those but
Stevie just drove me mad.

[Stuff deleted]

>documents, it fiddles with the CR/LF pair, converting it to a LF. HOWEVER,
>some counter of line length doesn't get told: because you'll find documents

Now thats interesting. I have a prog that creates large text files.
While the lines are short, the problem occurs when I fiddle with them
using Elvis - [OK I know]. I'll try that & see what happens.

[more deleted]

>I call this a feature. When a shell escape crashes you machine, you will too.
>(provided you use a recoverable ramdisk - harddisk /tmp is too slow).

Yes, but I'm a coward at heart. I always save before shelling out.

On another tack. Does anyone use elvis under gemini? I find its screen
refresh in the console window *very* slow. Any way of improving this?

John

Hi minix hackers,

Just a small note to tell you that I will be visiting the atari fair in
Duesseldorf (germany) on 21/8 or 22/8 (we haven't decided yet on the day
to go). I was wondering if there are other minix hackers visiting the
fair and possibly arrange something so we can meet each other.

If you are also visiting the fair and are interested in meeting me,
please drop me a note on which day you will be visiting.
I propose to meet at 12 or 1 o'clock. Place to be defined. If you
have a good proposal, let me know.

Hope to see a few minix addicts in Duesseldorf.

1419. Packing data...

Newsgroup: comp.sys.atari.st
Date: 1992-08-10 13:27:44 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1992Aug10.132744.23799@aston.ac.uk>
Source record: 218938

I've been investigated packers recently (Ice Packer, LSD Packers, 4Pak) and I've noticed that several have options to pack data as well as executables. Maybe I'm missing something obvious, but I don't see how packing data can help but render it unusable, as the program loading it (be it a WP, spreadsheet or whatever) will not realise it has to be unpacked and will see it as garbage. I can only surmise a couple of possibilities - 1, that the data is unuseable and has to be unpacked first (in which case the packers are behaving in a function analgous to archivers in this context) or 2, that programs are supposed to be written to recognise packed data and unpack it (which strikes me as rather hopeful :) so I guess I must be missing the point. Someone care to enlighten me as to how packing data is, in fact, useful?

1420. Re: Transfer of text files between ST and MS DOS

Newsgroup: comp.sys.atari.st
Date: 1992-08-10 13:32:37 UTC
From: saj@chinet.chi.il.us
Message-ID: <BsrsAE.52y@chinet.chi.il.us>
Source record: 218768

Just to make sure the mechanics are clear, to format a disk on a PC compatible
that will be usable on an ST, you do a
format <D> /s:9/t:80
Where <D> is the drive letter. If the DOS version this is done under is earlier
than MS-DOS 5.0 (don't know about DR-DOS), the disk will not have a proper
serial number, so it is essential that an ST user access a disk formatted on
an ST in between using any 2 disks formatted this way.

Any disk usable on the general ST (this specifically includes 10-sector and
twisted formats, but not disks with too many tracks) can be made usable
on a PS/2 (and most compatibles) by putting the magic hex bytes (see faq) at
the start of the first sector. (I won't force you to find the faq. EB 34 90)

Steve saj@chinet.chi.il.us

1421. Re: Jeff Minter's TRIP-A-TRON

Newsgroup: comp.sys.atari.st

Message-ID: <1992Aug10.140007.23985@aston.ac.uk>
Source record: 218940

Sorry to disappoint you, but Trip-a-Tron is not PD or shareware, but commercial software which sell for around 25 UK pounds. There is an earlier version called 'Colourspace' which ought to give you some kind of idea, which is on atari.archive somewhere- probably the graphics demo. Trip-a-tron is far more complex though, containing (I believe) its own programming language amongst other things. If you're interseted, Llamasoft's address should be with the C'space demo.

1424. Re: What's the best vi editor for the ST?

Newsgroup: comp.sys.atari.st
Date: 1992-08-10 16:27:29 UTC
From: kemp@uiatma.atmos.uiuc.edu
Message-ID: <Bss0Dv.JG5@news.cso.uiuc.edu>
Source record: 218944

Not a "vi" editor, but a fantastic text editor for the ST
is the program "Tempus". It is by far the fastest scrolling
editor I have ever seen on any computer.

I used it for coding when I was in CS, and it is really
easy to work with. It was so good I would ship the files
to my PC at home, work on them in "Tempus", then ship them
back to the mainframe for compiling.

Highly recommended,
JohnKemp@uiuc.edu

1425. Atari ST - 1meg, color, 85meg HD - $600

I have the following Atari ST system for sale:

I'll pay 1/2 of the shipping, and I will take $600 for the entire system.

Reach me at:
kuzemcha@tartan.com
or epkst1@unix.cis.pitt.edu

(all prices in US Dollars)

520STM 150
1 meg, TOS 1.4, RF modulator

SC1224 color monitor 100

85 meg HD, dual floppy 350
This is a Seagate 296N SCSI drive
with a ICD host adapter (with clock).

HD, host adapter and two DS Fujitsu
floppy drives are in a 3-bay gray
shoebox case with its own 150 watt
power supply. Really nice setup.
I'll leave all the PD stuff I have on
the disk. (10+ meg).

Single-sided ST floppy drive 15
Older than the rest of the stuff,
but still works.

Software:

Mark Williams C and CSD v3.0.5 30
WordUp v3.0 15
DevPac ST v2.0 assembler 10
NeoDesk v3.0 10
Forth MT (Abacus) 10
Degas Elite v3.01 10
ProCopy 10
G+Plus 10

Games:

Falcon, Marble Madness, Tetris, Xenon 2, 7 ea
Heroes of the Lance, Airball, Mindshadow
Crystal Castles, Strip Poker, Leisure Suit
Larry II.

Well, I am the author of ShadowTerm II. That is why I am more than a little confused as to why it never showed up at atari.archive or comp.binaries.atari.st when I sent it.

Before I mention the features of the program, I should mention one thing; if you do manage to find the program, all of the files should be copied to drive A: (only temporarily) so that it runs okay when it is first started up. ShadowTerm II is very (very) picky about finding files where they should be. Since I wanted the program to run on a 520, I had to be loose on error

checking.

The program has the following features (and more):

-Automatic logons performed by ShadowTerm II for you.
-A scrollback buffer (with a viewer).
-Many disk functions (copy, move, delete, rename, free space, create directory, delete directory, etc.).
-Support for thirty macro keys.
-An excellent dialer (that even supports chain dialing).
-A special feature that allows you to run any of ten programs with a single keypress.
-A full featured terminal mode (send date/time, message taglines, and more).
-An online notepad that has four pages and allows you to clear, save, transmit, or print any group of notepad lines or the entire page.
-A standard, easy-to-use GEM interface.
-An optional status line at the bottom of the screen.
-You can dial any of the first ten entries in the dialing list from the main menu with a single keystroke.
-ALL functions have keystrokes for them.

If you are looking for a terminal program, this is a good one to have.
I just wish it was where it is supposed to be....:)

1427. TOSWIN.ACC query

Newsgroup: comp.sys.atari.st
Date: 1992-08-10 19:44:39 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1992Aug10.194439.12118@news2.cis.umn.edu>
Source record: 218948

I've spent the last few days setting up MiNT 0.95 and the GNU suite of programming tools (BASH, GNU C, MiNT libraries and include files, the GNU File utilities...). Currently I am calling BASH directly, so the GEM desktop is never really seen. However, there are times when using the TOSWIN.ACC program could be useful. There is a problem, though.

How can I get rid of the 2/3" high letters that TOSWIN insists on using on a color monitor? I'd much prefer the straightforward 80-column text mode of medium-res to which I've become accustomed. Putting up GDOS fonts isn't going to be worthwhile, since I currently do not have it installed on my system.

Solutions anyone?

1428. Falcon article in Atari Advantage

Newsgroup: comp.sys.atari.st
Date: 1992-08-10 19:50:08 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1992Aug10.195008.12227@news2.cis.umn.edu>
Source record: 218949

I found the description of the Falcon in the 'June/July 1992' issue of Atari Advantage interesting. After careful examination of the back of the machine (on page 28) and the accompanying caption, I am at a loss to determine where the Falcon's video port is supposed to be. As far as the caption is concerned, one is stuck with the RCA jack for RF-video to your television set. I =think= that the (apparently) 19-pin D-connector next to the SCSI II port is supposed to be the video port. Can anyone else offer information on this?

I tried all combinations and without other stuff in the auto folder etc.
Without success. Then I tried a minimal MiNT configuration on my old ST:
TOSWIN had no problems!!
So this is definetly a TT-only bug (or feature :-), and other German TT users
reported the same behaviour. If you could get a hand on a TT and look after it,
many TT owners would thank you very much, Eric.

Regards, Markus.

Hopefully if Dan Wilga reads the net he can post.

I have 8megs in my TT and I can only get 102 icons, so I don't think RAM is the limiting factor. I recall something about a limitation in resource files, but I don't know anything specific about it. I believe Dan was working on a way around it, although I don't know what kind of success he's had.

(BTW, I had the same limitation in my 4meg STE and Mega STE.)

1436. TapeBIOS Driver: Where is it?

Newsgroup: comp.sys.atari.st
Date: 1992-08-10 22:14:46 UTC
From: plate@cdsmn.mn.org
Message-ID: <1992Aug10.221446.14600@cdsmn.mn.org>
Source record: 218764

A short while back, people were talking about Alan Horihane's TapeBIOS software. I thought I had saved any info I might have needed to get hold of it, but all I can find is an old article saying how good it is.

Where is this software? I don't even know the name of it to do a search.

Thanks,
Doug Plate

> isn't going to be worthwhile, since I currently do not have it installed
> on my system.

Select "Set Default Font..." from the Global menu. You will be stuck with only one choice for the font (namely, the system font) but you will have a choice of sizes. The smallest is the 6x6 font, the next smallest is 8x8, and the next (default) is 8x16.

After you've chosen a default that you like, select "Save Config..." from the Files menu.

I realize that the documentation for TOSWIN is somewhat sketchy, but is it really that hard to figure out?

Yes. Toad Computers at 556 Baltimore Annapolis Blvd. in Severna Park MD is one of the best. You could call them first at (410)544-6943 or (800)448-8623. I have used their services on several occasions and have been well satisfied with the service and impressed by their knowledge and helpfulness.

Atari has released NOROACH for this purpose and there is also another program
called BOOTTYME which should do the trick.

Supra has such a modem for under $300.00. If I remember correctly the
price is closer to $250.00

1443. MiNT and GEM

Newsgroup: comp.sys.atari.st
Date: 1992-08-11 03:07:09 UTC
From: azog@world.std.com
Message-ID: <Bsstzy.Hnn@world.std.com>
Source record: 218769

I dont know all the ins and outs of how GEM deals with things, so this may come across as a silly or stupid question...

When I boot my machine, mint.cnf loads ksh as its INIT, instead of GEM. Sometimes I start GEM (with gem.prg, supplied in one of the older MiNT distrubutions), and sometimes I start MGR...

Instead of rebooting my machine to switch from GEM to MGR, I like to open Gulam, and issue a kill -9 0, which kills GEM. From there Im back at the initial ksh shell.

The question is that after I kill GEM the first time, I cant restart it without rebooting my machine. I am just curious as to why this is happening, in the hopes of better understanding my machine. I once read that GEM allocates all memory for itself, but shouldnt killing it release that memory? Or is there a better way of killing it without signal 9?

This is a side question, again to satisify my curiousty... How come two GEM processes run? One is real small, and the other has all allocated memory. This is both with the old gem.prg and bootgem.prg that I found in the 095 kit.

Thanx

>Do I have to get rid of my favourite programs to use MiNT ? (say No! :-)

Some programs become pretty meaningless once you use MiNT. Who needs Rufus,
when you can run any-old terminal program in a window/in the background?

My modus operandi is to fire up Uniterm, auto-login, quit-uniterm, then
just use a really DUMB "terminal program" (home-made con <-> aux
echoer), run rz in the background (with:

ulimit -d 160K; /mint/bin/bg -o rz.out rz; ulimit -d unlimited

), then do some more work. If you have a screen-accelerator, and better
eyes for small fonts than I do, TOSWIN would effectively give you Rufus,
by running say "TIP" (the vegetable-simple term prg) in a window.

After all this time collecting nifty programs, all I want now is some
SIMPLE programs!!

*** Aside HINT: ***
Some programs that you used to think worked okay with the "fast" bit
set may not really have worked - and they seem to show up under MiNT.
(eg. the grep I am using). So if a program doesn't work, clear the
"fast" bit, and try it again.

Running VI in the console window gives you nothing, as the cursor is
disabled the whole time anyway. Better off setting ELVIS_TTP="w:n"
(ie. don't run it in the window, but use full-screen) in your
mupfel.mup.

>now discovered how much easier GEM makes routine tasks. IS this support
>(non-support) rumor true?

DRI has an operating system called FlexOS that uses (a version of) GEM, so I'd guess they still support it to some degree...

>Has anyone heard what effect this will have on Atari's interfaces? My bet is
>that there are enough third parties out there to keep things GEM-like. Does
>anyone have any hard facts?

...but the primary support for Atari GEM doesn't come from DRI, but rather Atari and Atari programmers. So, I don't think Atari GEM is something to worry about. (And to tell you the truth, I don't think many programs have been written to be portable between PC and Atari GEM...)

Sorry that the above was not really hard facts... :-)

1450. Think C Debugger Fix

Newsgroup: comp.sys.atari.st
Date: 1992-08-11 06:36:51 UTC
From: loomer@kiwi.ucsb.edu
Message-ID: <5458@ucsbcsl.ucsb.edu>
Source record: 218789

This should be of interest to all you Atari owners
out there who are using Spectre 3.0 and programming with Think C 5.0:
I have created a patch that makes THINK C 5.0 Debugger Work with
Spectre GCR. It's a small program that needs to be run only once after
which you can experience the inner joy of source level debugging.
I am making this program available for free to whoever wants it, with
one small catch: I'm interested in getting an idea of how many people
"out there" fall into the category "Programs in Think C with an Atari
Computer" and so initially will only give the program to people who
directly request it.
You can request it through email (loomer@kiwi.ucsb.edu), in which case I'll
email you a BinHexed copy of the program,
or you can mail your request-WITH A BLANK FLOPPY- and a buck to cover
postage(extra donations also accepted) to:
Paul Chinn, 1000 Klub Software, 1717 Rita Place, Santa Rosa, CA 95403.

Otherwise you'll have to wait a month or so before I allow its release
into the public domain.

1451. Major TERMCAP question!!

Newsgroup: comp.sys.atari.st

From: woocm@essex.ac.uk
Message-ID: <5003@sersun1.essex.ac.uk>
Source record: 218771

Okay, so I have mint, and running on top MGR. I can list compile
etc. quite happily. Now I need to edit something using my version of
micro-emacs I got via the CS-TEX distribution. Only problem is it
doesn't work because of the varying window sizes.

I know that this all has something to do with TERMCAP, a little
shell cariable that has lots of funny characters in it. But what the
hell is termcap exactly. I been using my Sun workstation for a while
not particularly caring about it. Sorry but now I would like to know
what its all about. Where can I read about it.

That said, I would prefer a small editor like microemacs or
a small version of VI to use as my editor under MiNT/MGR, will the
CS-TEX one work, can anybody suggest one that will. If so can
anyone help me at least get an editor that I can use until I can
understand all this TERMCAP stuff.

Thanks, much appreciated,

C.W.

Sure, thats easy for you to say. My termcap is 141,250 bytes. But
Fortunately I have a program to do that for me..

Also pertaining to mint. I am running Mint 0.95 and am having a few
problems with make. I have gnumake 3.62 from atari.archive, but when
I type make I get :
ttp: out of memory
Or something like that. Any idea what may be causeing this? I have
4 megs of ram, am running tcsh 6.0.1 gcc 2.2.2 gas 1.38 or 9? etc.. I
would really like to be able to use make!!!

From: naffara@crc.ac.uk
Message-ID: <1992Aug11.135724.19581@crc.ac.uk>
Source record: 218775

Does anyone out there know where I can get hold of some new fonts for
Timeworks 2?
I really need some fonts which are quite big (any up to about 5cm high!)
I would also like some different "fancy" styles.
Is there anywhere I can download them from? (if so, how do I do it?)
If I have to buy them does anyone know where to buy them and how much they
cost?

Changing the subject slightly, what does GDOS do? I know it's something to do
with the fonts but thats as far as my extremely limited knowledge goes :-}
I think if I remember right I have version 1.1 (may be 1.2!)

Thanks as always for the help, it's appreciated!

It is. The card is the TOS Extension Card from Artifex in Germany. Codehead
Technologies has imported it and will supply the Atari ROMs with the board.
Total package costs $139 for a 520ST. The May issue of Atari Advantage did
a review of it. If you want the numbers to Codehead, or Atari Advantage for
a copy of the review, let me know.

1460. Atari Portfolio, not another group!

Newsgroup: comp.sys.atari.st
Date: 1992-08-11 16:43:06 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Aug11.164306.17279@sactoh0.sac.ca.us>
Source record: 218780

I have a Portfolio, and use it everyday, and take it with me
wherever I go.

But let's not have another newsgroup, PLEASE! If anything, there is
a newsgroup for handhelds, comp.sys.handhelds, where they discuss
HPs, Psions, whatever.

> term st52 not powerful enough to use emacs cursor positioning. But
> the termcap entry is the one I got from the readme file for emacs.
> Any clues on how to get it to work??
Once I had the same problem. The solution is quite simple, but not
too easy to find out:
Edit your /etc/termcap file with an editor (akpEmacs or elvis or ...)
that does *not* end the lines with <CRLF>, but only with single <LF>s.
If you take the termcap file from the archive, it should work if you
do not edit anything at all. Then you can go and edit it with Emacs
itself :-)

Regards, Markus.

1462. .IMG files, what are they and how can I convert them to postscript?

Newsgroup: comp.sys.atari.st
Date: 1992-08-11 17:09:22 UTC
From: tjl@brspva.enet.dec.com
Message-ID: <1992Aug11.170922.2628@dscomsf.desy.de>
Source record: 218776

Hi,

I'd like to generate postscript output from C-Lab Notator 3.1. From
what I have heard, C-Lab
have "copped out" of providing a postscript driver for any future
version of Notator by suggesting that you need to buy a professional DTP
program to do the job. I guess this is so
they don't have to include royalties to Adobe in thwe proce of Notator.

Does anyone know of and PD/Shareware utilities that will perform this
conversion, or where I can get information about the contents of these
.IMG files.

Regards
Tim Llewellyn

1463. Atari stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1992-08-11 17:39:37 UTC
From: eggert@sun.lclark.edu
Message-ID: <1992Aug11.173937.19856@lclark.edu>
Source record: 218777

Since the sale of the items fell through (the guy didn't pay the c.o.d),
they are up for grabs again.

I still have the following items for sale: $400 Takes all, or split up as
follows...

Atari 1040 STf - $200
1 meg RAM
with Atari mouse
Atari SC1224 - $95
Screen bows at top and bottom. This is
apparently due to a burned out capacitor.
Should be an easy fix.
VideoKey - $50
Use a TV or VCR with your ST.
Works great!

Software -
Laser C compiler. . . . $50| or both for
Laser C Debugger package. . . $25| $65
GST C Compiler $15
Personal Pascal $15
Quantum Paint $10
BBS Express! ST $30
Universal Military Simulator . . $15
Falcon Flight Simulator. . . $20
Bloodwych $20
Dungeon Master . . . . $20| or both for
Dungeon Master II: Chaos Strikes Back . $20| $30
Chrono Quest $20
Carrier Command $20
Gone Fishin' $10

I also have many disks with public domain and shareware files, and quite a
disks from magazines such as STart. These would go with the computer if sold.

Again, all of this could be had for $400. I will pay shipping on any of this
assuming it is pre-paid. I will ship c.o.d. if desired, but I ask that the
buyer pays for that.

1464. SysQuest dual 88Mb drive and ST

Newsgroup: comp.sys.atari.st
Date: 1992-08-11 17:50:38 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Aug11.175038.18141@sactoh0.sac.ca.us>
Source record: 218781

I have a question about using SCSI drives.

At the local CompUSA store, they have external dual 88Mb Syquest drives for the price of about $650. This is substantially less than the price I have seen from Atari retailers for even the single 44Mb drive. I understand that as is, it will not work with the ST unless you have a host adaptor (am I correct?)

If this is so, can I simply get a host adaptor (for around $100, I think), connect it to my Mega 4, then connect the SyQuest to it using an SCSI cable??

I would prefer the removable format, as it is not hampered by total storage, and the fact that I can transport my disks very easily.

I believe the single 44Mb drive is under $500.

From: anson@akb.in-berlin.de
Message-ID: <H.ea.2XpBK29YNIk@akb.in-berlin.de>
Source record: 218788

Hallo !

In <H.sDfYSqWB6ms@nathan.do.open.de>, Udo Erdelhoff writes:
() > Ive set things up to the point where I can send local
() > mail, but when I try to send mail to my Unix box, something must
() > be wrong with the xhosts file, cause it complains.

Without knowing details about the error, it's impossible to help.
Please tell us what the software is complaining about !!!

If this is the same problem which is just described in another article with
the subject 'Hermes / rmail doesn't work', then I might help both of you :-)

() watch out when reading the Hermes documentation. There's a file called
() "xhosts.txt" within /usr/man/man5. 95% of this text are written in German,
() but the reminding 5% are written in English and describe the xhosts file.
() This only true for newer docs (1.03 and higher), if you are an older version
() you should update ASAP.
() PS: The english/german mixture within the docs is typical for Hermes, the
() author is quite busy and therefor he could only translate the important things.

Future docs will be written more in English, less in German, because Germans
understand English :-) and Americans don't understand German :-(and because
the author doesn't have the time neccessary to write two versions of the docs.
But it will take quite some time until all docs are in English only ...

() I think that some more netters would like to have this infos, so I'll
() post them here...
()
() -------------------------cut here-------------------------
()
() The following lines are really one line that has been split
() to fit on the page. You can split lines in the file by putting
() a '\' character at the end and an arbitrary number (even zero)
^^^^^^^^^^^^^^^^^^^^^^^^^
() of whitespace characters on the beginning of the following line.
^^

In version 1.03, this has to be EXACTLY ONE character (for the line with
the path) !!! In future versions, more than one character will be allowed.
(Martin was notified, the 'feature' is corrected, but not released yet)

If there is more than one character (eg. 8 spaces instead of one TAB),
rmail will try to use a path ' /path...' which results in the
errormessage ' /path... not found', but who will notice the spaces
to the left of the 'real' path ? :-)

The other poster wrote that the problem would be corrected by not calling RMAIL directly but calling it from uuwork/doqueue. This is only correct to one part : by calling UUWORK once, the file XHOSTS is rewritten with exactly one TAB at the start of the lines. After XHOSTS is reformatted, you can work with RMAIL like before, without the need to call uuwork again.

btw: the same error (only exactly one TAB allowed) shows up in nearly all versions of 'make' on nearly all computers :-) :-(

The correct termcap entry for tw52 is the one put into the TERMCAP=
environment variable by TOSWIN.

Thanks, I got this one figured out. Part of my confusion came from the
fact that I tried to get TOSWIN working before my system configuration
was set up properly, and I ended up corrupting my copy of the binary.
After reinstalling TOSWIN and setting up my shells correctly, it works fine.

Has anyone considered a menu compiler for TOSWIN's .mnu files? I have
started work on one, but I'm not sure what the user interface should
be. I could use GEM or a CLI front end, and if I chose GEM the
program should probably be a DA. It would be easier to get the data
from the command line than from a file, because the VDI keycodes are
generated by the user's keystokes and returned by the BIOS. If I get
the program to read in files, I will need a translation table.

All suggestions are welcome.

> you're interseted, Llamasoft's address should be with the C'space
> demo.

It was rumoured a few months back that Trip-a-Tron *might* be released as shareware at some point; but maybe this was just a rumour after all.

I have a (legitimate) copy of Trip-a-Tron and must confess to being somewhat stumped by it, largely due to the interface, which I find needlessly obtuse and twee in its presentation (unhelpful sheep icons, the same functions deliberately called by different names in different screens, and so on).

The annoying thing is that I'm sure that underneath all this games-style presentation is a very powerful program. If any other users have thoughts on the program (ease of use, end results etc.) and feel like mailing me about them I'll summarise the overall opinions in this newsgroup.

Thanks.

1476. MIDIFEST NEEDS PERFORMERS, Come and play at WAACE AtariFest 92'

ATTENTION ALL ATARI MIDI ENTHUSIASTS!

This is your chance to get out of that basement and show the world what all that MIDI gear you play can do. Were looking for people interested in performing at this years Atari MIDIFEST.

This year as Director of the MIDI events at the WAACE AtariFest I am heading up a MIDI festival that will run alongside the Atari Computer Festival held on October 10th & 11th at the Sheraton Reston in Reston, Virginia.

The AtariFest is put on yearly buy Washington area Atari user groups. Last years festival attracted nearly two thousand people from all over the US and Canada. This year we expect even more with the addition of the MIDIFEST.

What I am looking for is people that utilize Atari computers for music and sound oriented productivity. Musical style is totally open, any sort of MIDI or sound based implementation is welcome. I only require that you provide your own computer and mixing. We will provide the sound reinforcement from your stereo or mono feed. If this sounds like something you want to do and you can travel to the Washington DC Metro area(travel and lodging discounts available), then please send email and a short profile on you and what you want to do at the Fest.

Serious inquiries please send email to;

1477. Apple to Atari ST file transfer ??

Newsgroup: comp.sys.atari.st
Date: 1992-08-12 12:49:30 UTC
From: ae24@iamk4516.mathematik.uni-karlsruhe.de
Message-ID: <1992Aug12.124930.3120@rz.uni-karlsruhe.de>
Source record: 218795

Hi, out there !

For a long time I have been working with an old apple II+ computer and developed several programs on it, which I also want to use on my new computer - an atari TT.

Unfortunately, I don't have any communication card for my apple II - and I don't believe, that I will get one anywhere - so I can't transfer any program to the atari (except by hand ...).

Trying to find a solution for this problem I had the idea, that it must be possible to connect the atari via the RS232-interface to the centronics printer interface of the apple II. (The most files I have to transfer are program sources, i.e. ASCII-files).
Thus I would transfer my files simply by "printing" them while the atari should simulate the printer, but store the incoming characters in a local file.

Does anyone know if the two computers can be connected in this manner - and if yes, what kind of hard- and software is necessary to do so.

If you have any idea, please send your response to the e-mail address given above.

Thanks a lot in advance !

Bug in TOSWIN...

I've noticed that the pop-down menus always pop down even if the window they're associated with is not the "top" window. Shouldn't they be deactivated if the window that they refer to is not the current window ? Or is this a design feature, because of the multi-tasking nature of TOSWIN ?

In fact, I'm using NVDI 2.03 on my (North American) TT with TOSWIN, and
haven't had any problems.

I've also tried a variety of different GDOS's with TOSWIN, and they've all
worked fine.

Perhaps there is a bug in the German version of NVDI? (The one I have is all
in English.)

Personally, I think that this is a bug in GEM (it shouldn't be sending mouse events to a program that doesn't have control of the mouse). At any rate, I will change TOSWIN's behaviour -- this bug has been reported by many people.

>I realize that the documentation for TOSWIN is somewhat sketchy, but
>is it really that hard to figure out?

Actually, no, but I haven't been able to get 80-column 'normal' text at all. Most of the menu selections for TOSWIN are greyed out on my machine (mostly those to the right of the menu bar). The Font selection uses 'point sizes' for some reason (rather than 6x6, etc.). The default on a color monitor appears to be 10 point, with the smaller choice being 8 point. Perhaps the action is different between monochrome and color monitors?

In any case, it appears I can go from 2/3" to 1/2" high characters and a scroll region which doesn't (scroll, that is...) unless one uses the window's elevator.

Perhaps some of the configuration information which is read in needs to be changed?

> TT doubles arrow events

There's a desk acce□sory called SCROLFIX to cure that. (I wrote it.) It's
very small, using only about 800 bytes of memory. It works with all ST and
TT machines, all version of TOS.

There's also a DA called BUTTONFIX, but it doesn't work on TTs, or so I've
been told. (I wrote SCROLFIX for a TT owner because BUTTONFIX didn't work
for him.)

SCROLFIX.ZOO (or .LZH) should be available in atari archives at umich.

>fact it is a great modem... too bad Supra cut out of the Atari market...

According to the discussion in comp.dcom.modems, the "heating problem"
is just because (due to its small size) the Supra uses the case as a heat-sink
so that you don't have to put in bulky fans, etc. There have been reported
problems, but the most serious (from a man who ordered 10) seems to have
been a bad shipment as nearly every other opinion has been positive. Of course
I am WAY behind on my reading of that group, so things may be different now,
but this is the way it looked a couple of days ago. BTW, if you do get a
Supra, try and get the 1.200C ROMs or later.

>.IMG files.
>
>Regards
>Tim Llewellyn

This may not be the quick and easy answer you were looking for, and there
may be better ways of doing it, but here goes.

There is a set of utilities to convert from anything to practically anything
else called the Portable Bitmap Utilities by Jef Poskanzer at the site
expo.lcs.mit.edu in the directory `contrib'. There are utilities in there
top convert from .IMG to pbm and from pbm to postscript (from pnm, actually,
but the portable formats are upward compatible).

The catch is, the archive only contains a set of generic source files that
need to be compiled, and will surely need to be tweaked to work on the ST/TT.

Now if some kind soul would be willing to take care of the compilation of this
mountain of utilities... :-). I might be able to be cajoled inot doing it,
but that would have to be sometime after I finally get around to download
gnu C (damn, I'm lazy!).

Irregardless of whether this suggestion is useful for the above problem, these
utilities would be invaluable (I was amazed that utilities were provided for
conversion of Degas, .IMG, .GEM (i think), and even Spectrum formats!).

1493. Spectre in Color?

Newsgroup: comp.sys.atari.st
Date: 1992-08-12 22:36:44 UTC
From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.713659004@cwis>
Source record: 218812

Hello everyone!

I have been using Spectre for quite a while now without many problems. One problem I have been having is when I run spectre on a color monitor. I have my colors setup so it uses the extra colors to achieve a perceived 640x400 resolution on a 640x200 screen. It looks pretty nice, in my opinion, and I wouldn't mind using it at all.

The problem is, when I run Spectre in color, the sound doesn't work! The initial startup sound (usually heard when you startup the mac) is flawless. I was amazed when I first used Spectre that the sound was so clear. But, when I get to the control panel and adjust the volume level (which probably does nothing, unless you set it to 0, except play the current digitized sound) the sound is played, but is extremely unclear. The next time I adjust the volume, the sound isn't played at all, instead I hear a crackling sound.

I have never had any problems with the sound on my st before, at all. Sound in ST programs is flawless. And here is something interesting, I ran a mono emulator on my color monitor, ran spectre (spectre didn't seem to recognize mono was on, because I got a split screen!) anyway, the sound worked fine! Obviously I'm not going to use the mono emulator, since I don't want a split screen (try reading text like that!).

Does anyone have any suggestions? (Perhaps a monochrome emulator that works under Spectre?) Thanks!

1495. I'd like info about blitter/upgrading

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 00:38:02 UTC
From: dvasilef@silver.ucs.indiana.edu
Message-ID: <dvasilef.713666282@silver>
Source record: 218816

I have an ancient 1040STF. It dates back to 1986, and I have
not made any upgrades or hardware modifications. I am considering
upgrading my 1040 or getting a Mega STe. However, I'm not really sure
what I should get to upgrade in order to compare the price of upgrading
or a Mega. Is the blitter chip very useful? Do many programs utilize
it? Currently, I use telecommunication, spreadsheet, word processing,
and light dtp applications. If the blitter is useful, can I even put
one in my 1040? And where could I buy one? Could I install it myself?
(meaning little or no soldering) How much would it cost? Would an
AdSpeed ST be more effective than a blitter. (In all likelihood, I'd
get a Mega STe before putting an AdSpeed in the 1040, but I'm just
curious about how and what these things do).

Feel free to email me any tips, suggestions, or advice you think
might pertain to my situation. I also plan on upgrading to 2.5M RAM and
installing a newer version of TOS. Someday I hope to get a hard disk,
but I don't know if I can afford it at this time. Maybe it would it be
better to just get the Mega w/HD all at once? Thanks, any help will be
appreciated.

David

Message-ID: <1992Aug13.004456.20430@usenet.ins.cwru.edu>
Source record: 218814

The Cleveland Free-Net Atari SIG will be holding a conference in the Multi-User Chat area of Free-Net (go cafe) on Sunday night 9 PM EST.

The channel will be +AtariCon and it may be invite only so you may need to send a request to enter the conference.

The topic will be on the possibility of getting a ST/Falcon support campaign going. It is pretty much well-known that the ST has been slowing where new software and hardware is concerned. The funny thing is, nobody knows why--I still buy software and I'm sure you do too!

Since Atari seems to be attempting to get itself together by releasing the Falcon 030, we may be able to help the Falcon by creating some wind.

This Sunday night, be there!

:)

>
There's source code in some of the packer distributions, so programmers
can use the packing format for their own data. Their also handy for getting
data from a disk whose loader doesn't work in 60hz NA mode.

If you want to pack data for your own files, there's 2 alternatives.

DataDiet from Double Click which compresses and uncompresses files
on their way to the hard drive.

AFX included in the Questor LZH archive. AFX also intercepts files
compressed using a special flag.

I haven't heard any major horror stories about either of these, though
I don't use them. Neither are free. AFX is shareware, and DataDiet is
commmercial.

Take a closer look at the ads again. For $259, you get the Supra 9600 modem, NOT the v.32bis (Supra 14.4).

The cheapest price I seem for the Supra v.32bis is $299. It is from a MAC mail order place. If anyone interested, I can get the name and phone number.

Obviously you'll have to contact Atari Corporations in Sunnyvale CA.
Falcons will be (as were the Mega STE and TT) available to developers
before, as I'm sure you know, they will be available to the gerneral
public.

Although he won't tell me, I know a developer in the Ohio area who I
believe is most likely going to have one of the first Falcons in the
Ohio area.

1506. Re: Wanted Sam Tramiel, conference transcript of GEnie

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 06:10:31 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <63950@cup.portal.com>
Source record: 218820

The Sam Tramiel conference on GEnie will no doubt be included in this week's ST Report...

But briefly, other than acknowledging the existance of the Falcon, and uploading an ASCII description of its features, the conference was more or less one long "No Comment"...

Any "real" information is being reserved for release at the Atari show coming up soon in Germany.

Sam did say that the Forbes article gave everyone at Atari a good laugh, and that the view from his "new" office is better than his "old" one..

Also in the realm of "Good News", the GEnie conferencing software didn't crash this time.

FOR SALE --

TOS 2.05 chips (from Mega STE) -- $45
Great for STE users!

Supra 2400 modem -- $80
Excellent condition, clean; comes with all manuals, power
supply, phone cord, and original packaging. In other words,
everything that was originally shipped with it.
with modem cable and 9-pin adapter for MSTE/TT -- $90

WD1772 floppy controller (from Mega STE) -- Best offer.

Golden Image Mechanical Mouse -- $35
No box, no manual, just mouse.

Epson 720K floppy drive (from Mega STE) -- $60

Calamus 1.09 and Font Editor 1.0 -- $100
Upgrade to SL!!

CyberSculpt (still shrink-wrapped) -- $35

UPS Ground shipping included. Prices negotiable. Please leave e-mail
or call 415-751-3693.
```

August 3rd, I have also read that they intend to do another article.

Also Computer Shoper (USA) has some Atari articles, one was on GEM
I think, and another one about Atari in a later magazine, but this is
all from memory, this I read on a Z-Net feed..

Also from what I have just heared that Atari is droping computer
sales here in New Zealand and in Australia..

The only thing that will be sold is the Lynx in OZZ and NZ, the Atari line of
Computers are now way over priced, even the Falcon will not be sold here..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

1513. Falcon _ Atari ST User

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 12:06:47 UTC
From: jvt@its.bt.co.uk
Message-ID: <1992Aug13.120647.17883@its.bt.co.uk>
Source record: 218839
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi All,
I've just got my September issue of Atari ST User (UK Mag) and in it
there is a 1 page preview of the Falcon including pictures! I cannot
comment on the authenicity but it will be interesting to compare notes
with US & D.

OK, here are the details from the mag:

first models expected in UK September
to be shown at London trade show - September 6.
68030 @ 16 MHz
DSP56001
8 channel 16 bit digital DMA, sampling up to 50KHz
4 channel stereo with recording and playback
262,144 colour palette
Max res 640x480 16 bit mode (65,536 colours on screen)
SVGA modes up to 256 colours on screen
Overscan mode (no black border)
15bit overlay mode for video titling etc.
MultiTOS
1.44 MB Floppy
IDE port for internal 2.5in 44MB hard drive
RAM: 1,4 or 14 MB
Optional 68882
Expansion slot for 386PC emulators or JPEG and MPEG data compressors
Ports
SCSI II with DMA
stereo microphone
audio out
monitor
midi
hi speed LAN (no they don't say what)
Joystick & analog joystick
printer port ``more industry standard''
working name was Sparrow
50 machines worldwide many at top software houses in UK (I presume
others are in D :-))
Atari Germany ``at least one model above and below Falcon030 including
68040''

rumours
price == 499 UK pounds
new case design next April

Sounds good if its accurate but some of the statements get me a little worried.

From: azog@world.std.com
Message-ID: <BsxD91.F6H@world.std.com>
Source record: 218836

Boy, sometimes it seems that I have more problems than its worth...

Last night, I had a strange problem with my ST. When I fired it up,
it started clicking like crazy, even tho I wasnt pressing the keys,
so I quickly did a power cycle. I fear that something happened in
there that may have damaged my MIDI ports, because now they dont
work at all.

Is there anything I can check to see if its really the ports, or perhaps
my keyboard that got messed up? When I play a sequence thru my sequencer,
it looks like its working, but no music. On my Kawai keyboard, usually
when I press a key, on the LCD display, it shows a block cursor to visually
acknowledge that MIDI data is being sent or recived.

I would hate to have to ship this somewhere for repair. (btw: its an
STe thats about 8 months old... I dont recall if I sent in the
warentee sheet, but how long is the warentee?)

Thanx

>MiNT freindly UUCICO would be nice.
>

You might want to take a quick peruse around Comp.lang.perl. Some guys at
University of Manitoba have just released a newsreader written in Perl,
that is designed to work identically with both DOS and Unix. This would
be a good opportunity to get the ST in there!

(Notable fact: Larry Wall, author of both rn and Perl, "is
talking about rewriting it in Perl." He's been busy with other stuff,
so maybe it's time that others get the task started.)

The program is called "brn", and weighs in at about 50K of code. It
needs Perl, so you can immediately add another 268K. This is still
probably smaller than trn, and probably more readable.

Of course, uucp would be required in addition to brn. I'd be surprised
if the Unix uucp were very hard to port to MiNT.

Summary: Kent Dalton doesn't know what he's talking about.

> In article <KENTD.92Aug5151644@zappa.FtCollins.NCR.com> kentd@FtCollins.NCR.com (Kent Dalton) writes:
>>
>>No. MultiTOS is the gross/disgusting ST-TOS with Eric Smith's PD MiNT
>>package (ironically, it stands for MiNT is Not TOS) hacked in.

(1) MiNT is not PD.
(2) MultiTOS has a new version of the GEM AES that works with MiNT.
There will be a number of new features in the new GEM.
(3) Atari's version of MiNT is not the same as the freely available one
(i.e. it will have more features).

>>Programs must be linked with MiNT to multitask

This is complete nonsense. Any ST program can run under MiNT, without recompilation or "linking". 99% of them will multitask; the exceptions are games that take over the whole computer (just as some games on the Amiga take over the whole computer and don't allow for multitasking).

I've deleted the rest of Mr. Dalton's claims, since it is clear that he hasn't seen MultiTOS (indeed, MultiTOS isn't even finished yet, so *no one* has seen the final version, and only selected developers have seen the beta test version). His idle speculations are rather far off the mark.

>didn't crash this time.
>

I didn't like two things about the conference.

The first thing was when he said if you want better resolution,
get a TT. I thought that it was sad when he said that because
it probably means that the 640x480 will be the highest resolutions
even on the higher-end Falcons. I hope this isn't the case.

I also didn't like the fact that you couldn't replace the 68030
chip with a 68040 at a later date.

There is one thing for certain though, we all know what the Falcon has,
but we don't know what it can do. It may have some very hot graphics
capabilities that we will not believe...

1528. MiNT Setups...

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 16:14:37 UTC
From: chang@assb01
Message-ID: <9208131614.AA08100@adelphi-assb01.army.mil>
Source record: 218848

I'd like to request that (successful) MiNT users out there share
their setups on the net. I think it would be productive sharing of info
out there, both those, who aren't using something that someone else is
using, but would like to if he/she knew it was there, and those of us who
aren't getting it to run as advertised. I personally cannot stay in
MGR for more than 15 minutes without crashing it and I can't get either
of my 2 fave editors to work under it, mg and and old Edgar Roegar emacs
that was on a.a ~ 3 years ago.

A sample format:

Computer setup.
Auto folder setup:
Init file contents, rc files, termcap, etc...
Directory structure of the mint/msg, mw2, gcc whatever (ls -R at
the top level would be optimal)
Things you use MiNT, i.e. gcc 1.40, tip, emacs, etc.
How you typically use it, i.e. running gem from the start,
WP, with bgacc running a terminal pgm, or MGR from boot up, one coding
window, one for the compiler, etc..

This also would help users debug their problems as instead if
Joe can't get gcc to run under MiNT, but Fred can't, with Fred's setup
as described as above, Joe should be able to duplicate it.

What say MiNT users, dabblers, gurus and gurus in training?

Fo

1529. First Graph...minor problem!

Hi, just posting a quick request about info. on "First Graph" (the absolutely excellent...and CANADIAN...graphing package). I have only been using the package for a little while...okay one weekend...but I seem to have a small problem. When printing the graphs out the GDOS fonts seem to 'wander' very slightly. Only by one or 2 characters, but I was wondering if anyone else had encountered this or is it due to the excessively old TOS version I have (1.0). Anyone out there used this??? I have found some programs requiring GDOS don't like Turbo ST (Timeworks DTP for instance), but this isn't the problem this time. Any other suggestions will be considered and appreciated!

1530. MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 16:37:26 UTC
From: bussche@ksla.nl
Message-ID: <01GNJ8WN0PK08WZAOJ@ksla.nl>
Source record: 218846

Hello! With the 095 release of MiNT I decided to give it a try, so I downloaded all .zoo files in the MiNT directory at cs.ruu.nl. During the unpacking I noticed that not everything is placed in the correct directory (infact most of the files unpack in the current directory.) For me this is really not very nice since I am not U**X guru and do not know where everything belongs. Isn't there a installation document somewhere around??? Zoo is very capable to create di-retories where needed, why is this not fully used?
Please can somebody give me a pointer to a NOVICE MiNT manual/document (Eric??) otherwise I might find myself behind my ATARI for weeks or so getting things right.
Thanks for any response. (I will summarize to make a FAQ document)

Egbert Jan van den Bussche (bussche@ksla.nl)

1531. Re: Wanted Sam Tramiel, conference transcript of GEnie

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 16:38:16 UTC
From: saj@chinet.chi.il.us
Message-ID: <BsxKvt.6uB@chinet.chi.il.us>
Source record: 218715

There were a few more things worth noting in and around the 8/12/92 GEnie conference: Sam said he had just gotten back from seeing the first plant production of Falcons, and that they'd be shipping (somewhere) in a week. He predicted US shipments immediately after FCC class B certification, which he expects about mid-October. Atari is NOT seeking class A certification as a fall-back (would be pointless, anyway). The Falcon seems to be very well designed to fit the home computer/entertainment machine niche, and is clearly differentiated from the TT (video, expansion connector, serial ports).

Bill Rehbock said that at least one third-party 'PC' emulator will be shown in a Falcon next week. He came as close as he could after the conference to saying that a 4MB RAM ST Book with a non-backlit display will be introduced as soon as technologically possible. Note that that's my interpretation.

Sam also said that he doesn't expect large supplies of Falcons in the US IMMEDIATELY after FCC approval--there'll be some, and the supply will ramp up afterwards.

The tone of the above is obviously baiting, and can be ignored. Just take out all the adjectives. Multi-TOS isn't really on view yet, but the

intention clearly seems to be to permit multiple GEM applications. The word preemptive was used in the description of it last night. It will certainly be better than MiNT running over native TOS....we'll have to see it to know how much better.

Atari's genuine UNIX should run on the Falcon, although the windowing environment would require add-on display enhancements (=$$$). It doesn't seem like an attractive thing to do, though. The generally UNIX-compatible MiNT libraries aren't really all that bad, and the various shells available should give a comfortable environment (for a home machine).

The native video of the Falcon 030 seems to be a little better than what Windows 3.1 supports without the use of OEM add-on drivers. A little more resolution and bandwidth would have been nice, but what's there should be good enough for many users.

As for pluses and minuses of SCSI 2: I could make a little list of CD ROMS, page printers and disk drives that will benefit. They're affordable if you need them, and looking forward sure beats looking backward with only ACSI.

All-in-all, a nice machine, that'll be able to run lots of existing software better than existing hardware, and that opens some new possibilities for home software (yeah, that DSP and its DMA channel.....).

Hi-

I've always wanted to dabble in writing BBS-type software... Well, the "high-level" part of BBS software (like the code that handles the user interface, that keeps track of where things are, that provides access to new and unique services, that sort of thing). What I have no desire to write, though, is things like the code to do an xmodem file transfer (for example), or the code that determines what speed somebody logged in at & then sets the RS-232 port appropriately... etc.

What I'm wondering is this: does there exist a body of code, in the public domain, that handles the kinds of things I've indicated as "icky" ? :-)

Thanks!
John

You are right - boy do I feel sucked in by the media. :(
Gawd I hate the fine print.

>
> The cheapest price I seem for the Supra v.32bis is $299. It is from a MAC
>mail order place. If anyone interested, I can get the name and phone number.
>

Actually, I have been in contact with some people on misc.forsale that
are trying to nail down a deal to purchase a large order of Supra's (~30) and
sell them for about $285+S&H. If you are interested, contact
myhre@plains.NoDak.edu - got a robot-response with a description of the deal.
To get the robot response you may need to put "RE: New Supra 14.4k Modems" in
your subject line.

Of course, there is another possibility: According to
Clari.streetprice, Comp-u-store OnLine sells the Supra for $282. They can
be reached at 1-800-843-7777.

I have no affiliation with either Compustore or Robert Myhre other than
the fact that I'm going to be getting a modem from one of them soon.... :)

I'm selling some ST stuff that I don't use anymore...

$3 each (or all for $20):
OCP Advanced Art Studio
Powerdrome
Manhunter 2: SF
Dragons of Flame
StarGlider
Universal Military Simulator
Deja Vu II: Lost in Las Vegas
Two on Two Basketball
Borrowed Time
Project Neptune
World Championshiop Karate

Populous II: Trials of the Olympian Gods $30

Power Pack..... $15
(Bloodwych, Lombard Rally, TV Sports Football
Xenon II)

STOS..... $15
Maxifile III..... $5
Laser C 2.1 + Laser DB..... $30
K-Roget Thesaurus..... $5

$5 for both books:
Abacus ST Peeks and Pokes $3
Abacus ST Machine Language..... $3

All software come complete box and documentation, of course.
I can be reached
at work: or at home:
limsico@lucid.com (415)587-2978
(415)853-5564 ext.6602

Thanks!

>even on the higher-end Falcons. I hope this isn't the case.
>

Well, as any 'future' models of the falcon may be a bit aways yet
I would assume Atari wants to continue sales of the TT unit.Thus,to give
folks the impression that higher res Falcons are just around the corner,
TT sales may drop below what they already are. Just a thought...

>I also didn't like the fact that you couldn't replace the 68030
>chip with a 68040 at a later date.
>

Hmmm... but as this was probably said of the ST too and then came the
030 boards, even though it won't be simply drop in replacements, which would
cost even more production-wise, for only a perhaps small number of Falcon
purchasers, 3rd party manufacturers have been known to 'do the impossible'.

Just some more discussion, nothing to serious <grin>

1539. Atari

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 18:23:09 UTC
From: heidelj@alleg.edu
Message-ID: <1992Aug13.182309.10852@pellns.alleg.edu>
Source record: 218704

Well, after reading this group for sometime now I thought I would share my ideas about the future of Atari and perhaps some of the things they are doing wrong.

My biggest turnoff of Atari the company (by the way, I do own a Mega STe.) is the fact that they wait too long. They wait too long to deliver any new products, they wait too long to inform the public on much of anything and it is an absolute killer. Quite frankly, I am surprised that they are still in busines.

Reading all of the articles pertaining to the Falcon on this group makes me happy and said. Happy because the Atari users are very faithful and loyal users, and sad because I know that it will take Atari quite sometime to deliver on any of "her" promises. I am particularly disatisfied with Atari's performance because of the rumors I hear. Rumors which state that the new Falcon will have the 68030. Sure this is impressive for the average Atari user who is primarily an Atari user, but what type of company would put a chip in a new computer that is slowly becoming too slow. For example, NeXT Inc. contained the 68030 chip in some of the first computers they came out with. Now, they are being shipped with the 68040 chip at approx. 33 mHz (if I am not mistaken). In any case, they are soon going to be shipping their computers with a new chip which is supposed to be even faster. My question is, why would any company, I don't care who it is, invest in technology which has surpassed and will soon be taken over by something else. I would agree with them if they shiped their computers with 68040, but I can't believe that they would like to slow themselves (the company) down by installing yesterday's technology. It just doesn't make sense.

As for the new support groups trying to get Atari back and supportive, I just don't see it happening. Do you recall the "Atari Revolution"? How much success was generated by that?

Just my $.02 worth.

>ESC T to TOSWIN from one of the windows.

If I open a TOSWIN window with MINTSHEL running inside, 'echo ESC-T' bombs out
the shell; I finally tried it on a minimal system; nevertheless the
problem didn't disappear:

This is a MEGA-ST1 with (German) TOS1.4.
I prepared a disk with only the following files on it:

AUTO\MINT.PRG
TOSWIN.ACC
TOSWIN.RSC
MINTSHEL.TTP

After system startup, open TOSWIN, create a std window with MINTSHEL in
it (no args) and enter 'echo ESC-T'.
In response, I get something like
pid 3 (MINTSHEL): BUS ERROR: PC=456205c (basepage=759d0)
The TERMCAP string gets printed, then MINTSHEL exits.

The Forbes article basically summed up exactly what Atari owners have been saying for years now. They cited examples of how the Tramiels tried to enter the market with inexpensive computers and VERY little advertising. It seemed to consider this to be Atari's downfall. Their marketing just hasn't been there. The article ended with a statement saying that the Tramiels had been successful with the same strategy for Commodore but that it hadn't worked for Atari and that the Tramiels aren't adaptable people.

They threw in some statistics also. I remember a comment about Jack Tramiel checking expense account receipts to make sure that restaurant tips didn't exceed 15%. They also mentioned a time when Sam Tramiel dissallowed a shipment of a couple cartridges overseas for a meeting with a big account because shipping was $54.

There wasn't a lot of good news in the article, if any.

Hi,
I have personnaly seen such a Falcon 030 running and I'm not so exited
!
Okay, the DSP might be interesting for some applications, but the
other features are not so exiting.

He is not as fast as a compared 386-40 Mhz which you can buy nowadays
for the same price.

The Atari Falcon is running only a 68030 at slow 16 Mhz !

Seems they did get the last charge from Motorola very cheapo !

And all the video titling you can get today with a Genoa Genlock board
for the PC for about 400 US$ which comes with free video titler and
you are ready to go !

For the Atari you still also need a Genlock box, which will be also
not very cheap !(and a program !)

Also I have now a 24 bits graphics board at 640x480 which is still a
difference to 32K colors, which the Atari does only !
I would never like to go back to only Hicolor instead of True Color !

So Atarri, you should hurry and get the 68040 out, cause otherwise, who
will buy such a machine, when there is no software to support it ?

Today only the software counts. You can have a very good hardware, but
when there are no programs for this machine, nobody will buy it !

Same was true with the Archimedes from Arcon, Uk over here in Germany.

It had a better hardware than all the STs and Amigas, but it was not
supported well enough over here, so only a few were selled !

So I don't think that many people will buy the Falcon 030.

Also the Falcon 040 will have a hard time, when there is the new P5
Intel Chip coming out this chrismas. I gonna buy then a 586
motherboard !

Best regards Stefan Hartmann.

1544. Re: Internet in Detroit

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 21:48:02 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92226.164802JJMCWILL@MTUS5.BITNET>
Source record: 218695

If this person has a way of getting an account with a Michigan mainframe, he might try checking into the MERIT/MichNET thing. There might be a local node in his area. I used to use this to call Compuserve and GEnie when I had accounts with them. The connection was limited to ASCII, so I couldn't download/upload files, but since there was a MERIT node in Houghton, and no GEnie or CIS node, I called these services through MERIT. CIS was free, GEnie was something like a couple cents per call charged through MERIT.

Jeff McWilliams

Sure it does. Remember that the Falcon is trying to hit an under $1000 price point. Motorola 68040s are _well_ over $200 in quantity, whereas 68030s are below $100 (from what I've seen). So if Atari wants to make a higher-end version of the Falcon based on a 68040, they can sell it for over $1000. But, they're trying to sell to a home audience, rather than the pricey NeXT audience (ever try to buy a NeXT machine for under $1000?). I'm certain not every Mac buyer is buying a Quadra right now due to the high cost of those 68040-based machines.

1547. Elvis 1.5 for MiNT (and TOS) uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-08-13 23:44:28 UTC
From: warwick@cs.uq.oz.au
Message-ID: <9808@uqcspe.cs.uq.oz.au>
Source record: 218713

I have just uploaded my port of Elvis 1.5 to atari.archive.umich.edu -
it is in the atari/new directory in the file elvis1_5.zoo

Notes:
1. Elvis 1.5 has VISUAL HIGHLIGHTING!!!!!!
2. This port does NOT crunch/uncrunch cr/lf - if the files
has cr's in it, they will show up on the screen
(but they can be easily deleted with ":1,$ s/^M$//")
3. This port does NOT busy-wait on the keyboard, so it is
much more friendly under MiNT (doesn't chew CPU)
4. This port DOES use termcap - and includes some termcap entries
5. This port SHOULD allow "national" keyboards to operate (can't test)
6. This port STILL allows you to map most of the Aly-key combinations
7. This port ALSO allows you to map the Contol-shift, etc. combinations
8. This port DOES allow shell escapes, pipes etc (under MiNT

But:
1. This port does NOT allows shell escapes under TOS [fork() fails]

Here is the Elvis 1.5 distribution's chat about the diffs from 1.4 to 1.5:

::::::::::::::
14to15.txt
::::::::::::::
Here's a quick list of features in 1.5 that aren't in 1.4

- Under MS-DOS, no system variables are accessed directly.
- Elvis now works under VMS.
- The "file is busy" limitation has been removed.
- Control-V quoting is more compatible with the real vi.
- The ":set warn" warning is only output on a ":!" or ":sh" command that isn't
being used as a filter.
- Function keys can be easily mapped in a terminal-independent way. The
":mkexrc" command will then save the mappings in a terminal-independent way.
- The `ctags` program has been modified to support ANSI C (somewhat).
- The `ref` program has been modified. It no longer needs a "refs" file
- A new ":color" command allows you to control which colors elvis uses.
(This only works right on PCs... running any operating system, though!)
- The ":set remap" option is now supported. Elvis allows recursive macros!
- A new option, ":set ruler", has been added. It causes elvis to constantly
display the current line/column numbers.
- Many small changes have been made to bring elvis a little closed to POSIX.
- In visual commannd mode, the new 'v' and 'V' commands let you *visibly*
mark the text that you want to apply a c/d/y/</=/>/\ command to.
- The \ key is a new operator command. It brings up a small menu.
- The = key is now an operator command that sends the selected text through

a predefined filter program. The default filter is "fmt", but you can change it via ":set equalprg=indent" or whatever.
- A clone of "fmt" is included.
- You can now move directly to a given percentage of the way through the file, via a command such as "50%". (The numberless % command still works, too.)
- Regular expressions now support the \{n\} and \{n,m\} closure operators.
- File preservation and recovery is now handled in a more vi-like way.
- Keyboard timeouts are now handled in a better way on SysV and BSD unices.

The main goals of 1.5 have been to fix bugs, improve portability, increase compatibility with the real vi, and add a few useful extensions. Most of the extensions can be individually disabled by compile-time options, if you like.

My favorite extension is a new *visible* way to select text to delete, yank, or whatever. In visual command mode, if you hit 'v', then the character under the cursor is hilighted. As you move the cursor around, all text from the 'v' spot to the current cursor position is hilighted. When you've moved the cursor to the end of the text you want to act on, you just need to hit one of the operator keys once. For example, "vwwwd" is approximately the same as "3dw". To cancel the selection without doing anything to the text, hit 'v' a second time.

The uppercase 'V' key does the same thing with whole lines, instead of characters. E.g., "Vjjjjj>" is a lot like ">5j" or "6>>".

The '\' key is a new operator which pops up a menu from which you can choose any of the most common operations.

All three of these can be mapped using the "visual" hack. This allows them to be used while you're in input mode. Also, I've experimented with using them in conjunction with a mouse, with the mouse configured like this: mouse movement simulates repeated pressings of the arrow keys, and the buttons send unique escape codes when pressed and when released. I mapped the left and right buttons to send 'v' and 'V' (respectively) when pressed, and '\' when released. This gives elvis a reasonably nice mouse interface, since the '\' pop-up menu is clever enough allow selection via arrow keys (mouse movement) and the '\' key (mouse button).

The '%' movement command can now accept a "count" argument. A plain "%" still moves to the matching parenthesis, as always, but "50%" moves the cursor to approximately half way through the file. I figured this might provide a nice hook for adding support for a slider bar in a windowing system, but I haven't actually tried it. For a similar reason, control-X now moves the cursor to a given screen column (taking side-ways scrolling into account), which I figured might be useful in conjuction with the 'H' command for adding simple cursor positioning in a windowing system. If the user clicks on row 5 column 27, then you could stuff "5H27^X" into the type-ahead queue, and elvis would move the cursor there.

The '=' key is a new operator which filters the affected text through an external program. It is similar to the '!' command, except that '=' uses a predefined command instead of asking you each time. The default program is "fmt", and you can change it via ":set ep=foo". A version of "fmt" is included. (In case you didn't know: fmt performs simple paragraph reformatting and word wrap.)

There is a new ":color" command. Its usage should be fairly intuitive. Try ":color light cyan on blue" first, and then ":color" with no arguments.

There are several new :set options. Most of them are SysV compatible. One nice extension is ":set ruler", which causes the row and column number to be continuously displayed on the bottom line of the screen.

The ctags command has been modified to work better with "new style" function definitions. Also, it has been extended to allow typedefs and static (local) definitions to be included.

The ref command has also been improved. Also, it has been extended to work well with the "static tags" option of the new ctags program. You are no longer forced to have a separate "refs" file (although you can if you want) because ref now reads the "tags" file and then looks up the function header. Elvis can be configured to call the "ref" program to perform tag lookup, so elvis can benefit from the more sophisticated lookup that "ref" offers.

Regular expressions can now handle \{m\} and \{m,n\} notation. The \{m\} operator means "the preceding single-character expression must be repeated exactly m times." The \{m,n\} notation means "the preceding single-character expression must be repeated at least m times, but no more than n times." If m is missing, it defaults to 0. If n is missing, it defaults to infinity. So "^-\{80\}$" matches a line of exactly 80 hyphens, and "[A-Za-z]\{10,\}" matches any word that has 10 or more characters.

The ttyread() function has been modified. It is now passed a "timeout" argument. This argument should be 0 to never timeout, or the amount of time to allow for a keystroke, expressed in tenths of a second. For SysV UNIX, this is implemented via VMIN/VTIME. For BSD, it uses select(). For other UNIX flavors, it uses the old SIGALRM trick and has poorer time resolution. All three UNIX versions are in the file "unix.c".

File preservation and recovery is now handled in a more vi-like way. A program called elvprsv extracts the text from a temp file and stores it in the /usr/preserve directory. A separate program called "elvrec" is used to recover the file -- move it from /usr/preserve to the current directory. Sadly, this makes installation more complex.

The tinytcap.c file has been completely rewritten, to make it smaller and more maintainable. More terminal descriptions are included in it now.

The ":set remap" option is now supported. Many of the more complex macro packages depend on this option. Also, support for maps and abbreviations

has been merged into a single, more cohesive package. Abbreviations work
a little better now than they did before.

From memory STR832 there are 2 Atari nodes that have closed there doors,
Scandinavia was one, so get a copy of STR832..

Also OZZ and Canada...??

The way its going the Falcon will never come out, go read Forbes
magazine 3rg August...

Get a copy of STR830 or it could be STR831/2, its all in there, plus more to come, as well as in Computer Shoper..

Main part was 'Cheap Did Not Sell' and they don't have to money to market the Falcon...

Roger..... sheppard_r@kosmos.wcc.govt.nz

>with this version since 17 May 1992. I can also use our `Umlaute'. I've
>no other editor on my HD.

Strange, I've never heard of Elvis 1.6, and archie only mentions a jelvis
(localised Japanese) 1.6 elvis. Not that it matters - it only took 10
minutes to port anyway. The main thing is to have a MiNT friendly version,
since all the `normal' TOS ports are brain-damaged (they busy-wait on the
keyboard in order to implement time-out, which screws multitasking
performance).

>The version I'm using has been ported by Juergen Lock <nox@jelal.north.de>

I'll give him a ping.

Atari Scandinavia IS out of business as for now. The old distribution is beeing reworked, with national distributors instead. They may get their machines from Atari Holland (or Be-Ne-Lux, I don't know what it's called). Theis can maybe result in lower prices - Ataris have always been too expensive in Norway. Atari Norway got their machines from Atari Sweden and then shipped them to a distributor...

Several people I know are waiting for something to happen as their businesses depend upon it. Some deals may be made during the Atari Messe in Dusseldorf later on.

Instead of bsd UUCP, I suggest using taylor UUCP from the FSF. From what I read on comp.mail.uucp it is very robust and the author would like to see a port to micros.

BTW, I would like to pay for hermes. what is the best way to ship money to germany? (lowest hassle, and/or fees to banks)

it also adds some interesting possibilities for Ham radio sw. there is a
big bunch of activity around DSP munching of signals and computer controled
radios.

I wonder if atari would consider a "loyalty pays" program similar to the
one telebit runs every couple of years. they could do something like trade
in your old machine and get a new falcon for 300$ off. nah. I'm just
dreaming.

Transcript of Formal Conference
August 13, 1992
Special Guest: Sam Tramiel
(copyright 1992, DELPHI's ST Advantage)

BIBLINSKI:Gordie>
Good evening, everyone, and welcome to tonight's formal
Conference. Our very special guest this evening is Sam Tramiel,
president of Atari Corporation. This is Sam's first visit to
DELPHI, and he's here to make an official announcement to us
DELPHI members about Atari's newest 68030 based computer.
Hopefully, he'll like it so much here, that he'll be back for some
future Conferences. <g>

I'd like to remind everyone that we are formal tonight (not in
dress, but in behavior), so our format is a little more
structured than usual. Sam will have some opening remarks,
after which he will take questions about those remarks, and
answer when he can. He can't talk about everything, yet, but
we should be able to get a fairly good feel for what the new
machine is like.

Because formal COs tend to take a bit longer than our regular
informal ones, we'd like to try to limit the questions to
tonight's topic, so we don't end up with a marathon session.
So, please don't stray too far from the topic at hand.

To ask questions when the time comes, you need to use the
/queue command. You'll be prompted for your question, then for
a brief description of the question. To provide as many people
as possible with a chance to ask questions, we won't take
direct follow-ups tonight. So, try to ask your question in
such a way as to be as complete as possible. I'll be keeping a
list of who has questions and will be trying to let as many

people as possible ask them.

Remember, too, that Atari will be formally debuting the new machine in Dusseldorf, Germany, next week. And they want to keep some secrets for that event!

.Gordie>
With that done, and everyone digesting it, <g> I'd like to thank Sam for taking a little time this evening to join us here.

Sam, the floor is yours.

.Sam>
Good evening, all. I'm very pleased to be here on DELPHI in the Atari ST Advantage area for the very first time! We're excited to be celebrating the 20th anniversary of Atari Corporation this year. We're especially excited because this is a time that we can introduce another milestone product to the world.

I'd like to take this opportunity to recognize some people that have been close allies of Atari Corporation. The entire staff of the Atari areas on Delphi, under the direction of Clayton Walnum and Gordie Meyer have been providing stellar support to our customers for many years now. As most of you know, the roots of the Delphi area were established in the days of A.N.A.L.O.G. Magazine. Delphi has long been a supporter of Atari products. Thank you Clay, Gordie, and the rest of the ST Advantage staff for your support of our mutual customers.

Tonight, we're pleased to be able to finally announce the Atari Falcon 030 Computer. This computer will be unveiled to the buying public at the Duesseldorf Atari Messe in Germany next week. The Falcon is a machine that we're very excited about. We think that it places us back in the forefront of the "Power without the Price" place in the market.

Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.

We see this computer as exceeding all of the multimedia
expectations of the computer buying public. As well as being
an exceptional value as a home computer system.

Extensive testing with the Falcon has already been done on
existing software. We are very pleased with the high degree of
compatibility. For instance, PowerNet, a increasingly popular
LocalTalk networking solution works fine with no modifications.
Calamus SL, PageStream, WordFlair II, Cubase 3.0, STalker 3.0,
STeno, Arabesque, and many other well written applications will
work perfectly.

I'm taking the liberty tonight of responding to some questions
that have already been submitted by the Delphi Staff, in order
that we might conserve some time:

What monitors will work with the Falcon?

The Atari Falcon030 will work with any VGA, or Atari ST
Color Monitor...SC1224 or SC1435

Suggested retail price?

Sorry, tonight we will not be giving out the suggested retail
price of the Atari Falcon030. That information will be
announced at the Duesseldorf Atari Messe in Germany next week.

Will there be a trade in plan?

It is not our practice to offer a trade in plan directly from
Atari. This is something that is up to the discretion of our
dealers.

Will there be a LAN?

Yes, there is a LocalTalk port on the Atari Falcon030. It is
fully compatible with the Atari Mega STE and Atari TT030.
PowerNet from DragonWare Software works fine with it.

Will there be a method to connect to a mainframe via ethernet?

No, there is no ethernet connector on the Atari Falcon030

Why no detachable keyboard?

We felt that offering the unit in this configuration was the
most cost effective. Also, using the 1040STE case allowed us
to save on design costs, as it is the only unit (until the
Atari Falcon030) that has analog joy sticks in it.

Will the DEKA work with it?

We do have a new keyboard controller in the Atari Falcon030.
We've not checked a DEKA unit with it yet. We'll have to get
back to you on that.

Have we hired a good technical writer, to document system interconnectivity, and add ons?

Our developer documentation for the Atari Falcon030 has met
with rave reviews from all of the developers that are in
possession of an Atari Falcon030. YES, the documentation is
greatly improved.

MultiTOS- how is it configured, ram or rom, and what software
will run on it?

MultiTOS is a combination of rom and disk based software. Most
well written applications seem to work fine. We've made
certain that our developers have been closely involved in the

enhancements of MultiTOS. I'm confident that it will be HIGHLY compatible with your software library.

Is there anything being done with multimedia, and/or speech recognition software?

Yes, Multimedia is one of the key area for the Atari Falcon030. However, I cannot go into specifics at this time. We do expect to see a lot of exciting applications at the Duesseldorf Atari Messe next week, though!

Will it be advertised? How big is the budget, is there an agency, will it be in mainstream media, or specialty publications?

Sorry, we're not going to enter into those kinds of specifics tonight. We'll be making announcements on all of those things either at the Duesseldorf Atari Messe, or shortly after it.

Any dealer incentive programs?

Again, we will not discuss the marketing issues tonight. That will be something that we'll pick up after the Duesseldorf Atari Messe.

Any bundled software with the Falcon?

Yes, there will be a number of things packaged with the Atari Falcon030. There will be a couple of games written especially for the Atari Falcon030...LandMines, and a BreakOut kind of game. We will also have a Rolodex type of application called Cal/Apt, a calculator application called ProCalc, and a Talking Clock desk accessory.

Is there a lease/purchase plan?

We already have such an arrangement in place for our products. However it is more orientated toward business purchases than home users.

That's it from us for now, we're ready to take questions from the audience.

Gordie>
Okay, folks. Sorry for the delay. There's a lot of buffer to search through for questions. Hang on a sec.

LMCCLURE>
Will the Falcon retain that name after it's release? If not, what will it be called?

.Sam>
Yes, the name is the Atari Falcon030.

BRITFLASH:Brit>
Will there be support for the future release of Apple/IBM OS "Pink"?

.Sam>
When we see it, we'll answer you. It's still in development. ga

PWRIGHT:PaulW>
Will it be able to run other operating system and which ones?

.Sam>
With plugging in optional third party coprocessor boards, you will be able to run PC type software, and maybe even MacIntosh software. ga

PIZZA_THIEF>
Is some sort of direct-to-disk recording/edit package under development (or slated for released concurrent with) the falcon? With the D/A converters it is reported to possess, this should be relatively easy to write.

.Sam>
Yes, there are several direct to disk recording systems under development. And we expect at least a few of them to be debuted next week at the Atari Duesseldorf Messe.

ATARIO:Steve>
Will memory upgrades be through SIMMs?

.Sam>
Memory upgrades will be through a "Atari Falcon" ram board.

RMARIANO:Ralph@STReport>
Sam, congratulations on the Falcon its quite the promising NEW product. I understand 500 are to reach Europe within two weeks. What is the time table for North America and the States in particular?

.Sam>
I'm happy that you have information on what is going to Europe. But, you're wrong, the plans are for North America to have machines by mid to late October.

BRYEDEWAARD:MegaRob>
What kind of keyboard will the Falcon come with? The old mushy ST-style version, or the newer Mega ST/Mega STE/TT one?

.Sam>
The Atari Falcon030 keyboard is the same wonderful keyboard that you can find on a 1040STE.

MERICKSON:Miles>
I noticed that the standard ACSI DMA port wasn't on your list of "standard ports." Does this mean that the Atari laser

printer will not work with the Falcon, or will a new controller be made available for use with the Falcon?

.Sam>
There are a number of fine third party developers that are working on a SCSI to ACSI converter box. ga

DAVIDNIELD:David Nield>
Sam, Thank you for coming. The introductory information was great. I would like to know what kind of digital recording the Falcon030 is capable of: Will the 16 bit digital recording be useful for direct to disk recording or 'simply' as a sound source for midi manipulative sounds? Any light you can shed on that aspect would be helpful.

.Sam>
Yes, you can use the Atari Falcon030 for direct to disk recording with appropriate software. Just plug a microphone into the microphone input.

HOWBAR>
Will the microphone input sounds directly, like the mac?

.Sam>
Yes.

CHUNK>
What kind of speed enhancments for the 030?

.Sam>
I don't understand the question...it is using a 68030.

.Gordie>
Chunk, did you want to clarify your question? <no response>
I'd guess he wonders about using a faster 68030.

.Sam>
The design and supporting chips is for a 16Mhz 68030, and 32 Mhz bus, which gives you a dynamite machine. Terrific performance! ga

TRIX:Trix>
Will there be a port of Microware's OS-9 Operating system for the Falcon030?

.Sam>
We're in regular contact with Microware, and OS/9 works for the most part just fine under the Atari Falcon030.

JBWHIT:JB>
When will development tools that support the 68030, math coprocessors and DSP56001 be available?

.Sam>
The developer machines that have been shipping to select developers for the past few months, have all the tools. A complete 56000 debugger will begin shipping next Thursday.

.Ron <ym>
You stated memory of 1, 4, or 14 Meg. Why 14 Meg? What's wrong with 16?

.Sam>
2 megabytes of RAM are masked out for backward compatibility with ST I/O space. We pride ourselves on maintaining downward compatibility with all of our products.

STGUEST:Oliver>
Sam, it was reported that Atari is going to introduce a new software packet called ST-Sutra at the Duesseldorf show next week (source: Atari Journal, Germany). Could you give us some details (features, price, availibility...) Another software-related question: Can you confirm that there will be a MultiTOS upgrade available for old STs (MC68000 machines)? Thanks!

.Sam>
We are saving this for Germany, Oliver. See you at the show! :) MultiTOS will be available for the Atari TT030. But we have no plans at present to make it available for 68000 based Atari STs.

TURBONICK:Nick>
You said that the Falcon can have 1,4,or 14 MB of RAM. In the 14MB configuration, is some of that RAM "fastRAM" like the TT has? Will the '030 have "burst mode" (or whatever it's called when it fetches multiple longwords in one instruction) access to that RAM?

.Sam>
All ram accesses are 32 bits wide. By the way, the supertechy questions are being answered by the ever capable Bill Rehbock. :) The ram does NOT operate in Nybble mode like an Atari TT030. ga

SGTR>
32 MHZ bus. Does that mean that the Falcon030 is capable of 32MHZ to RAM,HardDisk etc... If not then what is the main impetus ?

.Sam>
That's a 32 bit bus, sorry for the confusion. It means that the Atari Falcon030 memory controller and DMA and video chips access memory at 32 bits wide at a time.

HUDSONHARDY:Hudson>
How will the TT and the Falcon relate compatability-wise?

.Sam>
They are very compatible. The Atari Falcon030 is actually more STE compatible than the TT030.

DPJ:Dana@STReport>
Sam, first, welcome to Delphi. In light of the recent Forbes article, how do you feel the Falcon will do to re-establish Atari in the marketplace? It sounds like the Falcon will be the finest Atari computer yet to come. GA

.Sam>
Regardless of the Forbes article, we feel that the Atari Falcon030 is a giant step in personal computing. It will help Atari re-establish itself in the North American market.

.Gordie>
Sam, one thing that sounds really exciting is the 8 channel 16 bit sound. Won't that make the Falcon030 a virtual recording studio in a box?

.Sam>
Gordie, YES! We are very excited. We forsee desktop editing in the future with the Atari Falcon030.

.Gordie>
Have any MIDI developers been working on implementing that capability? That you know of, anyway?

.Sam>
YES, a leading developer in the UK, around Cambridge, is working on this type of software.

.Miles>
In a previous message, you said "and maybe even MacIntosh software." Does this mean that the Falcon isn't compatible with Spectre?

.Sam>
The Atari Falcon030 does not have an external floppy connector, and this of course makes it difficult to connect the existing Spectre GCR. We simply do not want to comment on Dave Small's behalf. :)

DAVIDSHORR:Dave>
Would you comment on some of the changes that were necessary to make the Falcon 030 more STe-compatible than its big brother the TT030 (the 16meg address space seems to be one)? Can the Falcon run Spectrum Holobyte's Falcon<grin>? GA.

.Sam>
Mostly custom chip issues. We haven't given Bill enough time to try Spectrum Holobyte's Falcon yet! He's been working too much!!

PHULSE2>
Hi Sam & Co. Two questions, first off, could you list the various developers which have been working on products for the Falcon? Any who previously dropped our computer and have show a renewed interest with the Falcon? Secondly, will the 'brains' of the Falcon be easily upgradeable to the inevitable 68040 release, or is that possible? Thank you very much for appearing here! Max @ 734

.Sam>
MultiTOS will indeed work with a 68040 platform. On the first question regarding developers, there are too many to mention now. And yes, some that were not working on our system are now. Such as NeXT developers because of the DSP 56000 which opens the world to really exciting software.

DIGISOFT>
Is there a true expansion bus or just a coprocessor slot, and is 640x480 the highest standard resolution? ga

.Sam>
Yes, there is a true expansion bus. It is a direct processor slot with all of the necessary goodies...interupts, etc. 768x480 in overscan is the highest standard rez.

.Ralph@STReport>
Sam, all my info may not be accurate, but that is not the question, I asked; "What is the timetable for North America and in particular, the USA?"

.Sam>
With all due respect, we've already answered you. The US is part of North America, and we plan mid to late October.

CHRYSTAL>
As I see it, most Atari users have little criticism of the hardware Atari produces, but are upset with the marketing of that hardware. The Forbes article also made that point. If not tonight, when will we learn what marketing strategy Atari has for the Falcon?

.Sam>
We felt that the present ST/STE family was not strong enough to market in the US. We have been waiting for this new product, and we do plan to support it and market it in the US. It will be a hard battle, but we will put a good effort behind it.

.Gordie>
Okay, folks, the clock on the wall says we have time for just one more question. And, that lucky person is... NORM!

NORMAN238:Norm!>
Will there be any "HANDS ON" looking at the Boston Computer Society's Meeting?

.Sam>
There will be hands, feet, etc on looking, touching, at BCS.
We will have more than one machine there, Norm.

Thank you all for coming tonight. We appreciate your support.
We've enjoyed our first visit to Delphi. Good night all, there
will be more information coming after the Duesseldorf Atari
Messe. Good night!

.Gordie>
That about fills up our time for tonight, folks. I want to
thank Sam, Bob and Bill for dropping by. Good night!

This CO is officially over!
